Barracuda Firewall - Overview

Searching Barracuda Firewall

The Barracuda Firewall is an application-aware network firewall appliance that is designed for organizations without dedicated IT personnel to manage firewalls. It leverages cloud resources to extend next-generation security and networking beyond the capabilities of typical security gateways or legacy firewalls. The Barracuda Firewall delivers application control, user awareness, secure VPNs, link optimization, and advanced malware protection. It combines application-control and network-security features with cloud technologies to provide up-to-date and dynamically scalable malware protection and content filtering. With the Barracuda Cloud Control centralized management portal, you can use a web browser or app to deploy, configure, and manage the Barracuda Firewall from any location.

Barracuda Firewall Release Notes Version 6.1.2.002

Please Read Before Upgrading

Before installing the new firmware version, back up your configuration and read all of the release notes that apply to the versions that are more current than the version that is running on your system.

Do not manually reboot your system at any time while the update is in process, unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, upgrading can take up to 10 minutes. If the process takes longer, please contact Barracuda Networks Technical Support for further assistance.

Barracuda Firewall version 6.1.2.002 fixes a log rotation issue to prevent filling up the SSD. [BNF-2217]
Barracuda Networks strongly recommends updating to version 6.1.2.002 or contacting Barracuda Networks Technical Support for assistance.

What's New with Barracuda Firewall Version 6.1.2.002

Access to the guest ticketing administration page is now possible from any network segment. A corresponding Redirect to Service targe
t was included. [BNF-2603]

Firmware Improvements

- The Session Expiration Length in Advanced > Secure Administration cannot be set to 0 minutes (unlimited) any more. [BNF-2591]
- Viewing DHCP settings through Barracuda Cloud Control now works as expected. [BNF-2589]
- Disconnecting and reconnecting a Barracuda Firewall from Barracuda Cloud Control and Web Security Service now works as expected. [BNF-2582]
- Custom naming of connection objects now works as expected. [BNF-2280]
- Connecting a Barracuda Firewall to Barracuda Cloud Control now works as expected. [BNF-2575]
- Editing service objects containing port ranges now works as expected. [BNF-2542]
- Using Client-to-Site VPNs with TCP port 443 now works as expected. [BNF-2541]
- Timestamps of the Event Log in **Basic** > **Alerts** are now displayed correctly. [BNF-2539]
- Exporting logs to CSV files now works as expected. [BNF-2538]
- Adding multiple MX records in the Authoritative DNS now works as expected. [BNF-2533]
- A NS record for DNS zones configured in the Authoritative DNS is now mandatory. [BNF-2497]
- The firewall rule testing feature is now also removed from the Barracuda Cloud Control. [BNF-2529]
- The shared secret string for IPsec VPN tunnels can now also contain underscores (_). [BNF-2500]
- DHCP lease ranges of VLAN interfaces are now displayed correctly. [BNF-2386]
- Uploading certificate files is now limited to certificate file types only. [BNF-2438]

Barracuda Firewall Release Notes Version 6.1.1.001

Please Read Before Upgrading

Before installing the new firmware version, back up your configuration and read all of the release notes that apply to the versions that are more current than the version that is running on your system.

<u>Do not manually reboot your system at any time</u> while the update is in process, unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, upgrading could take up to 10 minutes. If the process takes longer, please contact Barracuda Networks Technical Support for further assistance.

Whats New in Version 6.1.1.001

- The Barracuda Firewall now offers an LDAP connection test feature in USERS > External Authentication.
- · Smart pre-submission input validation is now also available in the LOGS > Log Streaming page.

Firmware Improvements

- Uploaded images on Users > Guest access are now displayed correctly. [BNF-2505]
- Restoring configuration backups now works as expected. [BNF-2258, 2492, 2489]
- DNAT firewall rules now correctly accept IP addresses in the Redirected To field. [BNF-2480]
- Deleting NAT objects now works as expected. [BNF-2453]
- The configuration dialogue for User objects was improved. [BNF-2435]
- The hostname of the secondary unit is now correctly reverted after removing a unit from an HA cluster. [BNF-2419]
- The Barracuda Firewall's hostname cannot end with "-HA" anymore. [BNF-2417]
- IP ranges for Wi-Fi networks in Users > Guest Access > Guest Networks are now preconfigured correctly.
 [BNF-2412]
- The initial HA clustering period was increased to avoid clustering issues. [BNF-2410]

- The status of the secondary HA unit is now displayed correctly after HA failover. [BNF-2400,2401]
- Wi-Fi SSIDs can now also contain "-" characters. [BNF-2380]
- Removing referenced Phase 2 settings of Client to Site connections now works as expected. [BNF-2276]
- Some minor issues of the configuration wizards were removed. [BNF-2272]
- Network names are now correctly displayed in FIREWALL > Captive Portal and USERS > Guest Access. [BNF-2348]
- Fixed an issue where under rare circumstances configuration updates failed and login was no longer possible. [BNF-2504]

Barracuda Firewall Release Notes Version 6.1.0.016

Please Read Before Upgrading

Before installing the new firmware version, back up your configuration and read all of the release notes that apply to the versions that are more current than the version that is running on your system.

Do not manually reboot your system at any time while the update is in process, unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, upgrading could take up to 10 minutes. If the process takes longer, please contact Barracuda Networks Technical Support for further assistance.

↑ To apply new QoS settings of this firmware, execute the following steps after you install the firmware update:

- 1. Go to the **FIREWALL > QoS** page.
- 2. Change one of the values on the configuration page.
- 3. Click Save Changes.
- 4. If you want, change the respective field back to its old value and click Save Changes again.

What's New in the Barracuda Firewall Version 6.1.0

New Barracuda Firewalls X100 and X101

At the lower end of the Barracuda Firewall range, the X100 and X101 with Wi-Fi desktop appliances with 4 x GbE copper ports are available at a lower price point and also at a lower performance level. 800 Mbps firewall throughput, 100 Mbps VPN throughput, 100 Mbps IPS throughput , 8,000 concurrent sessions and 2,000 new sessions per second. Both models support the complete feature set, except SSL VPN.

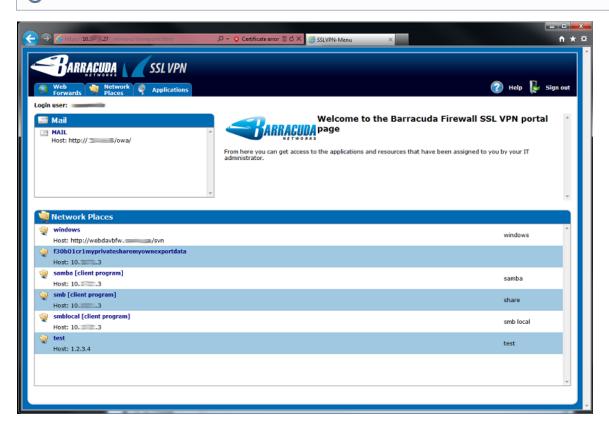

SSL VPN

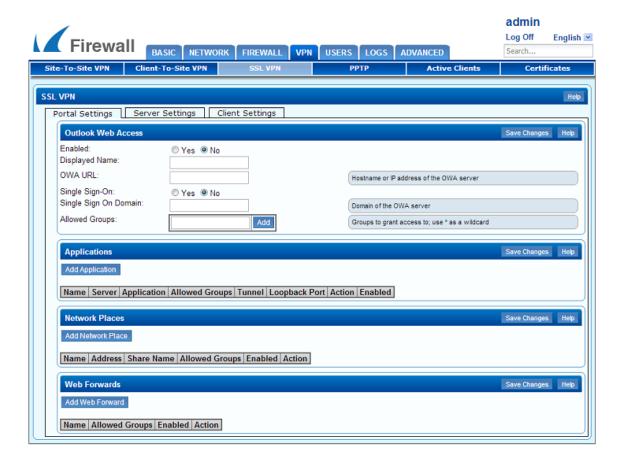

For the Barracuda Firewall X200 and higher, SSL VPN is available to provide VPN capabilities that can be used with a web browser. Unlike traditional client-to-site VPN, SSL VPN does not require the installation of client software on the end user's computer. Use SSL VPN to grant remote users with access to web applications, client and server applications, as well as internal network resources like Outlook web Access, **SMB**, **RDP**, **Telnet**, **SSH**, **SMTP**, **POP3**, **VNC**, **IMAP4**, **webDAV**, and **HTTP** and **HTTPS** web forwards.

SSL VPN is available at no additional cost for an unlimited amount of users. Depending on the performance level of the appliance model, Barracuda Networks recommends the following maximum numbers of users:

Model	Recommended Max. Users
X100, X101	SSL VPN not available
X200, X201	25 users
X300	50 users
X400	100 users
X600	200 users

Depending on the Firewall and VPN usage of your Barracuda Firewall, the recommended number of maximum users may vary.

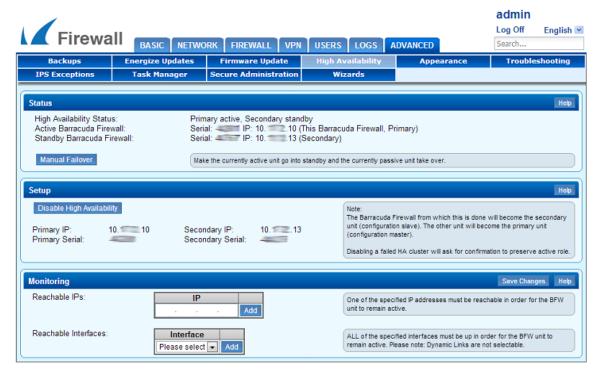

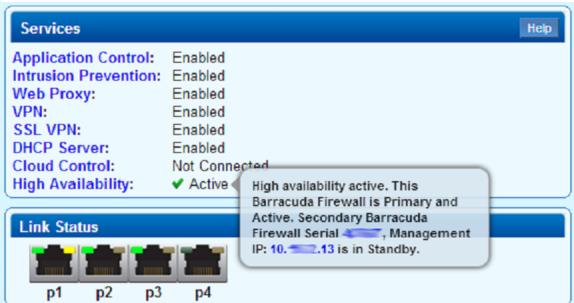

High Availability

All Barracuda Firewalls can now be deployed as part of a High Availability (HA) cluster. The primary unit handles all network traffic and security functions, while the secondary unit waits in standby mode to take over if the partner unit fails. The secondary unit automatically inherits all configuration changes from the primary unit.

①

You can only set up a HA cluster with two identical Barracuda Firewall models (e.g. two X101, two X200, or two X400) that run the same firmware version. Both units must be licensed identically to prevent loss of security coverage in case of a failover. You can configure HA on the **ADVANCED > High Availability** page.

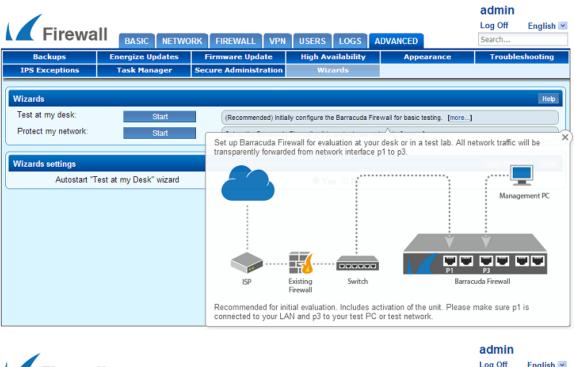

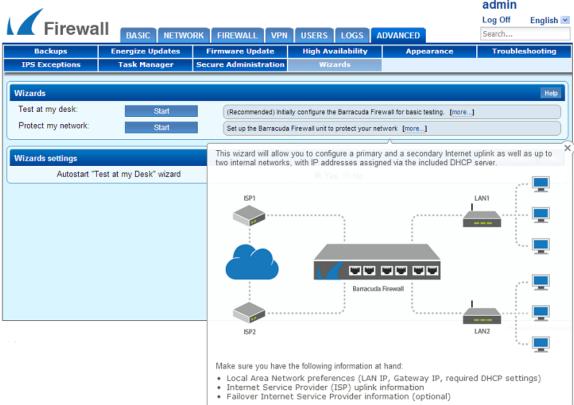

Configuration Wizards

All Barracuda Firewalls now offer the following configuration wizards to guide you through initial setup and configuration:

- The **Test at my Desk** wizard for initial activation and deployment in an evaluation and test scenario. This wizard starts automatically during your first login.
- The **Protect my Network** wizard for activating the Barracuda Firewall, as well as creating a primary and a failover Internet uplink and up to two internal network segments with optional DHCP IP address assignment.

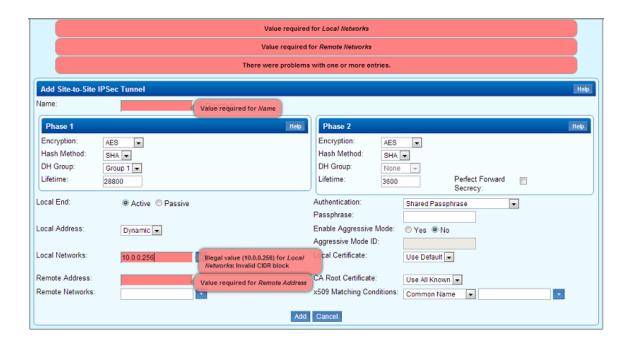

The wizards are available on the ADVANCED > Wizards page.

Smart Pre-Submission Input Validation

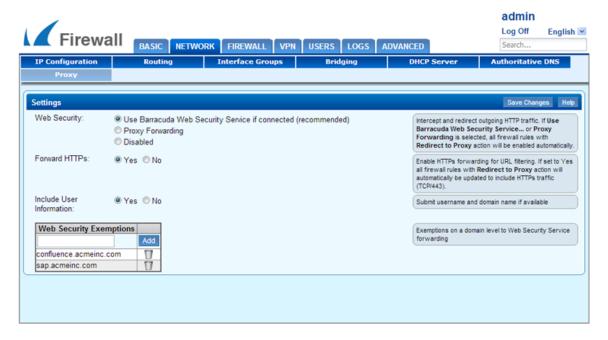

All Barracuda Firewalls now offer smart pre-submission input validation. This validation prevents configuration pop-ups from closing and losing entered information before all required fields are filled.

URL Filtering of HTTPS Websites and Web Security Service Exemptions

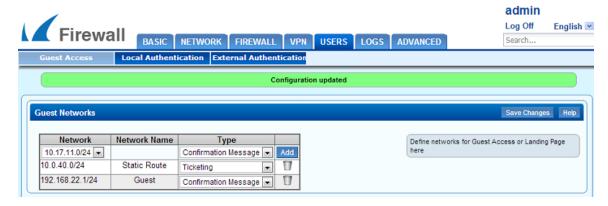

All Barracuda Firewalls can now apply URL filtering provided by the Barracuda Web Security Subscription to websites accessed via HTTPS.

Additionally, you can exempt user-defined domains or IP addresses from being forwarded to the Barracuda Web Security Service for HTTP and HTTPS.

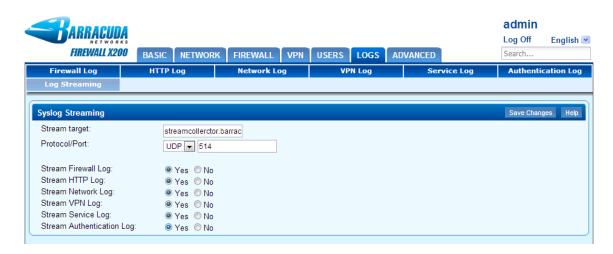

Guest Access for Non-Wi-Fi Models

All Barracuda Firewalls now also support the guest access feature for wired network segments. Configure guest access on the **USERS > Guest Access** page.

Log Streaming

All Barracuda Firewalls now support streaming log files to an external syslog server. You can activate syslog streaming per log file on the **LOGS > Log Streaming** page.

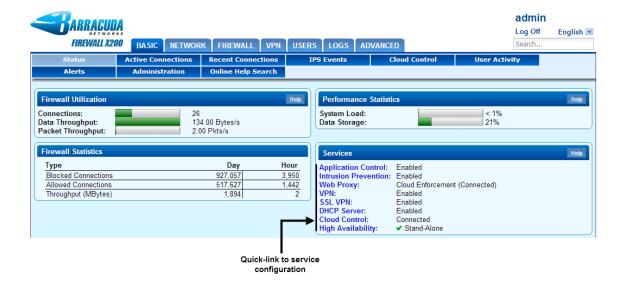

Usability Improvements

Quick Links to Service Configuration Pages

On the BASIC > Status page, you can click the services listed in the Services section to open their configuration pages.

For certain services, additional information is displayed when you hover over the service.

Quick Links to Barracuda Labs Reputation Search in Logs, Active Connections, and Recent Connections pages

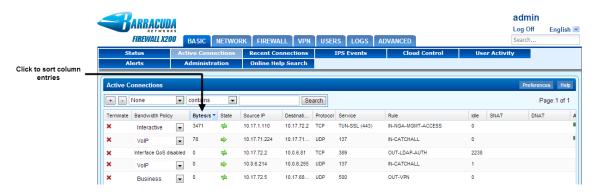

On the **LOGS** pages, **BASIC > Active Connections** page, and **BASIC > Recent Connections** page, you can view information from the Barracuda Labs Reputation Search about an external IP address by clicking the address in the **Destination IP** column.

Filtering for Active Connections and Recent Connections

The **Active Connections** and **Recent Connections** list filters have been updated to apply *contains* or *doesn't contain* as match criteria. You do not have to type exact search phrases and can enter negative search criteria.

Column Sorting for Active Connections

On the BASIC > Active Connections page, you can sort entries by clicking the column header.

Double-Click Instant Editing of Firewall Rules

Firewall rules can now be edited by double-clicking anywhere (outside of Actions and Disable) in the corresponding line.

Service Details within Redirect to Service Rule

When you configure a Redirect to Service rule, a read-only Redirect to Service Details section replaces the Service section in the Add/Edit Access Rule editor window.

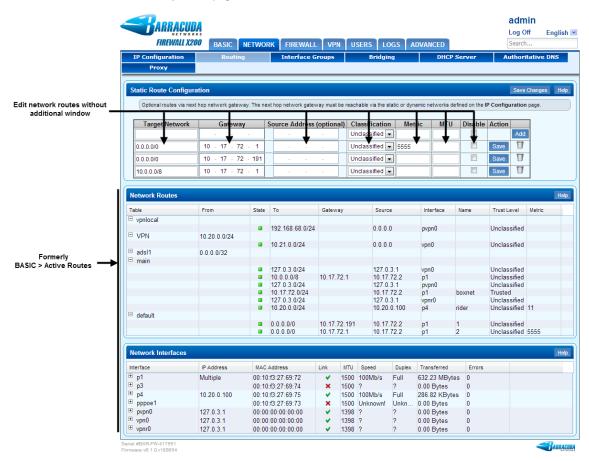

New NAT Objects Tab

The NAT Objects section previously located on the FIREWALL > Connection Objects page has been moved to its own page under the FIREW ALL tab.

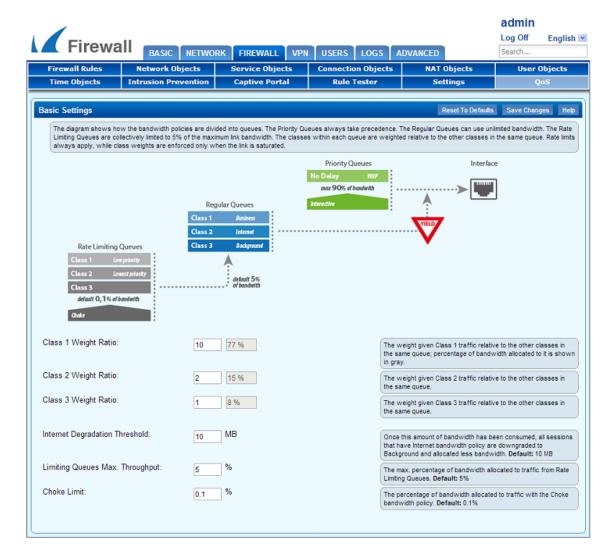

Active Routes User Interface Improvement

The **Active Routes** tab previously located in **BASIC** has been moved to the **Network Routes** section on the **NETWORK > Routing** page. You can now edit network routes directly on the page.

QoS: Configurable Throughput of Rate Limiting Queues

On the **FIREWALL > QoS** page, the diagram that explains QoS queues was updated to match other graphics in the 6.1 release. Additionally, you can configure the throughput of the rate limiting queues.

Download Barracuda VPN Clients through UI

All currently available Barracuda VPN clients can now be downloaded from the Settings section of the VPN > Client-To-Site VPN page.

Minor UI brush-up with new Barracuda Networks Logos and Improved Graphics

The logos and login screen for Barracuda Firewalls have been updated to match the new Barracuda Networks corporate theme.

On the ADVANCED > Appearance page, the new Barracuda Firewall image can still be replaced.

Firmware Improvements

- Using umlauts in PPTP user and group conditions now works as expected. [BNF-859]
- . The custom welcome image is now displayed correctly when connecting with VPN clients. [BNF-1404]
- Local PPTP user names can now also begin with a brace. [BNF-1570]
- Automatic DNS forwarding now also works for TCP port 53. [BNF-1590]
- Terminating active user sessions now also works through Barracuda Cloud Control. [BNF-1666]
- Secondary IP addresses can now also be added to static network interfaces. [BNF-1729]
- Filter settings on the Active Connections page are now correctly displayed after a page refresh. [BNF-1734]
- Network activation now also works if the Barracuda Firewall is not activated yet. [BNF-1823]
- The description field of firewall rules now also accepts forward slashes (/). [BNF-1836]
- The button to join a Windows domain is now located in USERS > External Authentication > NTLM. [BNF-1837]
- It is now possible to manually restart a 3G network interface. [BNF-1865]
- It is now possible to use the number sign (#) in Web Security Service passwords.[BNF-2110]
- It is now possible to add different DNS records for the same IP address. [BNF-2179]
- DHCP log file archiving now works as expected to prevent malfunction of the DHCP service. [BNF-2217]

• Barracuda Firewalls can now be reloaded and rebooted if the unit is not activated yet. [BNF-2230]

Known Issues

- **High Availability**: Manually triggering an HA failover is only possible on the currently active Barracuda Firewall unit. This issue does not affect automatic failover of HA clusters.
- High Availability: Changing the management IP address/network on HA units may lead to firewall service interruptions and loss of traffic flow. Barracuda Networks recommends that you change the management IP address/network <u>before</u> you deploy an HA cluster.
- **Web Security Subscription**: When blocking SSL encrypted web sites, the web site request times out instead of displaying the Web Security Service's block page.
- Wi-Fi: Channels 12,13, and 14 are currently not supported.
- Configuration Backups: If the automated backups feature is not in use and you want to restore a
 configuration backup from a file, first go to ADVANCED > Backups > Automated Backups and set Server
 Type to Off.
- **High Availability:** HA pairing might fail if the system clocks and time zones of the primary and the secondary unit are not correctly set. Before initiating the pairing process, verify that the system clocks and time zones are accurately set on both units.

Barracuda Firewall Release Notes Version 6.1.0.r189384

ⓓ

Version 6.1.0.r189384 is an alpha release for QA and demo purposes. This release is neither available through the early availability (EA) program nor through the beta program. The beta release of Barracuda Firewall 6.1.0 is expected within a couple of weeks after this alpha release. General availability is expected about four weeks after beta.

- · Release Highlights
 - New Barracuda Firewalls X100 and X101
 - SSL VPN
 - High Availability Support
 - Configuration Wizards
 - Guest Networking for Models without Wi-Fi
 - Log Streaming
- · Usability Improvements
 - Quick Links to Service Configuration Pages
 - Column Sorting for Active Connections
 - Quick Editing of Firewall Rules
 - NAT Objects Tab
 - Active Routes User Interface Improvement

Release Highlights

New Barracuda Firewalls X100 and X101

The Barracuda Firewall X100 and X101 (X101 comes with Wi-Fi) are available at a lower price point and also at a lower performance level. The Barracuda Firewall X100 and X101 will be able to run all services, except for SSL VPN.

SSL VPN

All Barracuda Firewall models except X100 and X101 will provide SSL VPN. In contrast to the typically used IPsec based VPN technology, the Barracuda Firewall SSL VPN technology does not require the installation of a dedicated VPN client at the end user's computer. Secure and platform-independent access is granted through the web browser to corporate network resources. The following applications are supported and easily configured:

- OWA
- SMB
- RDP
- Telnet
- SSH
- SMTP

- POP3
- VNC
- IMAP4
- WebDAV
- Web forwards (HTTP/HTTPs)

All Barracuda Firewall models starting with X200 provide SSL VPN at no additional cost for an unlimited amount of users. Depending on the performance level of the Barracuda Firewall model, Barracuda Networks recommends the following maximum numbers of users per model:

Model	Recommended Maximum Users
X100 & X101	SSL VPN not available
X200 & X201	25 users
X300	50 users
X400	100 users
X600	200 user

Depending on the Firewall and VPN utilization of your Barracuda Firewall, the recommended maximum user may vary.

High Availability Support

All Barracuda Firewall models support high availability clustering of two units. The primary unit handles all network traffic and security functions while the secondary unit operates in standby mode, taking over all functions when the primary unit fails or is being maintained.

Please note that HA clustering requires two identical Barracuda Firewalls models (e.g. two X101, two X200, or two X400) with identical license subscriptions.

Configuration Wizards

All Barracuda Firewalls offer configuration wizards to facilitate easy initial setup and configuration. Initially, two wizards will are available:

- Test at my Desk The wizard for initial activation and deployment in an evaluation and test scenario. This wizard is provided during the
 initial login to a Barracuda Firewall.
- Protect my Network The wizard to easily activate the Barracuda Firewall, creating redundant Internet connections with two Internet Service Providers and up to two internal network segments with optional DHCP IP address assignment.

Guest Networking for Models without Wi-Fi

All Barracuda Firewalls support the guest networking feature, even units without the integrated Wi-Fi option.

Log Streaming

All Barracuda Firewalls support log file streaming to an external Syslog server. Log streaming can be activated for each log file type. However, there can only be one destination server.

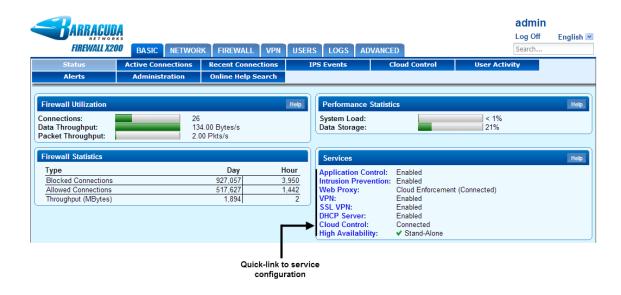

Usability Improvements

The following sections describe the usability improvements that are available as of firmware release 6.1.0.

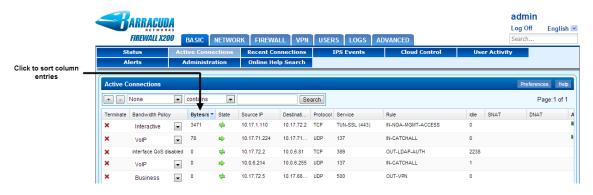

Quick Links to Service Configuration Pages

On the Status page, links in the Services section are now available to provide quick access to the configuration pages of all available services.

Column Sorting for Active Connections

Entries on the BASIC > Active Connection page are now sortable by column.

Firewall rule entries can quickly be edited after their firewall rule entries are double-clicked.

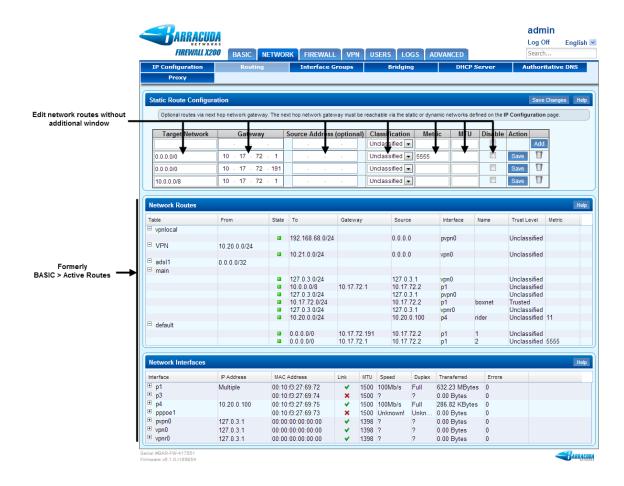

NAT Objects Tab

NAT objects are more intuitively integrated into the user interface and can now be found in a dedicated tab.

Active Routes User Interface Improvement

The Active Routes window is now consolidated with the network routes configuration window. Network routes are now directly editable.

Barracuda Firewall Release Notes Version 6.0.4.001

After installing release version 6.0.4.001 on your Barracuda Firewall, it is necessary to perform a configuration update to correctly apply all improvements.

Open Firewall > QoS and perform a temporary configuration change of one of the available settings, and click Save Changes.

Please Read Before Updating

Before installing any firmware version, make a backup of your configuration and read all of the release notes that apply to the versions that are more current than the version that is running on your system.

Do not manually reboot your system at any time during an upgrade, unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, upgrading could take up to 10 minutes. If the process takes longer, please contact Barracuda Networks Technical Support for further assistance.

Firmware Improvements

- Enhancement: The DHCP TFTP Host Name field now also accepts IP address and host name combinations. [BNF-2121]
- Fix: The internal interface assignment of the QoS bandwidth policy Internet now works as expected. [BNF-2072]
- Fix: Phase 2 settings of IPsec Site-to-Site VPN tunnels are now loaded correctly. [BNF-2098]
- Fix: The Barracuda Firewall can now be connected to Web Security Service accounts containing a hash (#) in the password. [BNF-2098]
- Fix: A potential shell command injection issue has been removed. [BNSEC-1422]
- Fix: A potential minor security issue related to local file permissions has been fixed. [BNSEC-1646]
- Fix: A potential minor security issue related to support connections has been fixed. [BNF-2084]

Barracuda Firewall Release Notes Version 6.0.3.001

Please Read Before Updating

Before installing any firmware version, make a backup of your configuration and read all of the release notes that apply to the versions that are more current than the version that is running on your system.

Do not manually reboot your system at any time during an upgrade, unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, upgrading could take up to 10 minutes. If the process takes longer, please contact Barracuda Networks Technical Support for further assistance.

Firmware Improvements

- Enhancement: It is now possible to disable the SIP Proxy. [BNF-1900]
- Enhancement: To simplify the firewall rule tester, time settings are no longer available. [BNF-1872]
- Enhancement: To simplify the user interface, the Memory Utilization indicator (Basic > Status > Performance Statistics) was removed. [BNF-2017]
- Enhancement: The Active Connections screen now allows performing a Barracuda Labs reputation search for globally routable IP addresses. [BNF-1800]
- Enhancement: The product documentation has been updated and improved to reflect the latest firmware changes. [BNF-1801 1802], [BNF-1804 1813]
- Fix: The DHCP server now consumes a lower amount of available memory. [BNF-1896]
- Fix: The Weight setting of Connection Objects is now saved correctly. [BNF-1870]
- Fix: PPPoE connections now accept usernames not containing the @ symbol. [BNF-1846]
- · Fix: ICMP reply packets from already terminated sessions are not leading to orphaned sessions any more. [BNF-1833]
- Fix: Network activations are now possible in any configuration tab, even if the product is not yet activated. [BNF-1824]
- Fix: An authentication bypass issue in proxied environments has been removed. [BNSEC-1226]
- Fix: Introducing multiple Wireless Access Points does now work as expected. [BNF-1893], [BNF-1997]

Barracuda Firewall Release Notes Version 6.0.2.001

Please Read Before Updating

Before installing any firmware version, make a backup of your configuration and read all of the release notes that apply to the versions that are more current than the version that is running on your system.

Do not manually reboot your system at any time during an upgrade, unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, upgrading could take up to 10 minutes. If the process

takes longer, please contact Barracuda Networks Technical Support for further assistance.

Firmware Improvements

- Enhancement: It is now possible to disable the SIP Proxy. [BNF-1900]
- Enhancement: To simplify the firewall rule tester, time settings are no longer available. [BNF-1872]

- Fix: The DHCP server now consumes a lower amount of available memory. [BNF-1896]
- Fix: The Weight setting of Connection Objects is now saved correctly. [BNF-1870]
- Fix: PPPoE connections now accept usernames not containing the @ symbol. [BNF-1846]
- · Fix: ICMP reply packets from already terminated sessions are not leading to orphaned sessions any more. [BNF-1833]
- Fix: Network activations are now possible in any configuration tab, even if the product is not yet activated. [BNF-1824]
- Fix: An authentication bypass issue in proxied environments has been removed. [BNSEC-1226]

Barracuda Firewall Release Notes Version 6.0.1.001

Please Read Before Updating

Before installing any firmware version, make a backup of your configuration and read all of the release notes that apply to the versions that are more current than the version that is running on your system.

Do not manually reboot your system at any time during an upgrade, unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, upgrading could take up to 10 minutes. If the process takes longer, please contact Barracuda Networks Technical Support for further assistance.

Firmware Improvements

- Enhancement: The DHCP service is now automatically restarted if a network activation occurs. [BNF-1591]
- Enhancement: NAT Objects are now able to introduce Proxy ARPs. [BNF-1705]
- Enhancement: Secondary IP addresses are now also available through the default network bridge P1-P3. [BNF-1668]
- Enhancement: The DHCP server is now able to assign DHCP options 66 (TFTP server name), 67 (Bootfile name) and 150 (TFTP server address) to clients. [BNF-1761]
- Fix: The Include User Information checkbox was permanently visible, although not available when using proxy forwarding. [BNF-1609]
- Fix: Moving a Barracuda Firewall to another Barracuda Cloud Control account did not work correctly. [BNF-1709]
- Fix: Source based routing in certain multi ISP configurationsnow works as expected [BNF-1630]
- Fix: IP addresses are now saved correctly when adding IPS Exceptions. [BNF-1602]

Barracuda Firewall Release Notes Version 6.0.0

Please Read Before Updating

Before installing any firmware version, make a backup of your configuration and read all of the release notes that apply to the versions that are more current than the version that is running on your system.

Do not manually reboot your system at any time during an upgrade, unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, upgrading could take up to 10 minutes. If the process takes longer, please contact Barracuda Networks Technical Support for further assistance.

Firmware Improvements

Click here to expand...

The following firmware improvements and updates have been implemented since the Early Availability release of the Barracuda Firewall.

If the Barracuda Firewall was not able to contact the Barracuda Networks firmware update servers, the Status page of the unit could not be loaded correctly.

Applying source IP address filters on the Active Connections page could lead to a high OS load, if the unit is currently forwarding a high amount of network sessions.

DNAT firewall rules can now also be used to perform port address translation (PAT). In the **Redirect To** field, append the desired port to the IP address. E.g.: 192.168.100.20:8080

The default firewall rule LOCALDNSCACHE now also includes TCP port 53 network traffic.

Applying filters in the VPN > Active Clients page did not work correctly.

The health status of units connected to Barracuda Cloud Control was not displayed correctly.

Removing of network interfaces now needs to be confirmed by the user.

The help bubble in the DNS record configuration window was updated.

The security definition update page (ADVANCED > Energize Updates) did not render correctly.

The Application Detection pattern database was updated.

The input assistant for CIDR IPv4 addresses was improved.

The secondary IP address of a static network interface was not loaded if the interface name contained an upper case character.

The hyperlink to the latest Energize Updates release notes was wrong.

PPPoE sub ID was added.

The unit's management IP address was not restored after restoring the unit with a configuration backup.

Local PPTP user passwords could not begin with a hash tag (#).

"Session Creation Load Exceeded" message was not correctly displayed on the recent connections page.

Shutting down the unit was not possible.

The web proxy feature was always displayed as disabled on the status page.

The input assistent routine for some configuration did not work correctly.

It was not possible to remove already configured Active Directory services.

Ampersands "&" were not allowed in Barracuda Web Security Service and Barracuda Cloud Control account passwords.

DNS resolving of IP addresses in the recent connections page did not work.

Pre-shared keys for Wi-Fi security could not begin with a hash tag (#).

The idle time of sessions was not displayed correctly.

The IP address of active DHCP leases was not displayed.

It was not possible to re-introduce removed Wi-Fi interfaces.

After updating units to firmware 6.0.0.001, some services did not start as expected.

The ticketing welcome screen erroneously displayed the background image of the Barracuda NG Firewall.

The message of the day release notes reminder could not be closed.

It was not possible to enter the user credentials when configuring a Dyn.com account on dynamic network interfaces.

The configuration dialog for adding connection objects was too small.

It was not possible to edit existing user objects.

The user interface could not be loaded when restoring a configuration backup including a certificate for secure administration.

The Energize Update and Premium Support subscription status was not displayed correctly if the unit was not connected to the Barracuda Cloud Control.

User interface rendering of the recent connection page was slow with huge amount of connection entries. The firewall log time filter user interface of the Barracuda Cloud Control was not displayed correctly. User objects were not saved correctly. A permission denied warning was displayed when creating Barracuda Cloud Control Account. Automatic warning pop-ups upon wrong configurations in the Barracuda Cloud Control were not displayed correctly. User interface speed was improved. Saving of firewall rules was very slow. Users were required to re-login after changing management IP before network activation. Help and preferences were missing in the HTTP log page. Time filter in alerts did not work. It was not possible to enter "-" in the Client to Site VPN policy. Rendering of BCC's summary page did not work correctly. Saving configuration backups to SMB shares was not working correctly. Internet Explorer reloaded page if bandwidth policy dropdown was opened. IPS pattern download did not work correctly. "Add Access Policy" window did not open in the proper size. Wrong axis labeling of transferred data graph on status page. It was not possible to import and select certificates for secure administration. Site to Site VPN with dynamic WAN IPs was not working correctly. Some host interfaces were not listed within virtual network configuration. Dynamic network interfaces configured to start manually, erroneously started automatically. Internet Explorer was not able to display the firewall rule set in BCC. It was not possible to remove health check target within the dynamic network interface configuration. Firewall status was missing on the BCC's status page. "Permission Denied" warning was displayed when creating a BCC account through the Barracuda Firewall. Barracuda Firewall displayed the wrong error message when disconnected from BCC. It was not possible to import and select certificate for secure administration. Active Client to Site VPN users were not displayed correctly. Firmware updates occasionally lead to the "Temporarily Unavailable" page. DHCP server subnets were not displayed in the DCHP server configuration. Editing of service objects was not working correctly. 3G SIM PIN was a mandatory field. It was not possible to add a default route without explicit metric. CPU, Mainboard temperature, and fan speeds were not displayed correctly.

Internet Explorer did not display active connections correctly.

Log filter for service logs did not work correctly. Filtering log files occasionally caused a temporary unavailable message. IPsec VPN tunnel status was not displayed correctly. Captive Portal was not able to use uploaded certificates. Filtering options in recent connections did not work correctly. Enabling/Disabling the captive portal did not work correctly. The Wi-Fi interface for ticketing administration was occasionally unreachable. Filtering VPN log for severities did not work correctly. Alert log entries were not ordered correctly. Saving configuration changes of two records at the same time did not work correctly. UserID was not displayed not filtered in the active connection page It was not possible to initiate or reset Site to Site VPN tunnels through BCC. It was not possible to reset Client to Site connections through BCC. Firewall user objects were not saved correctly. It was not possible to edit DHCP subnets through BCC. Editing custom network objects was not working correctly. Editing interface MTU and link speed was not possible through BCC. Footer of the Interface Groups page was not displayed correctly. Including ARPs on the recent connection page was not possible through BCC. Flushing entries on the recent connection page was not possible through BCC. Adding time objects through BCC did not work correctly. Editing network objects occasionally opened the wrong page. Custom user objects were erroneously listed as predefined user object. Editing time settings in time objects did not work correctly. Updating recent connection was very slow. It was not possible to filter for source or destination NAT in the firewall log viewer. Security definition update page was not displayed correctly. Editing user objects was not possible. Add connection object page was not displayed correctly.

Barracuda Firewall Technology

The unit for firewall statistics on Basic > Status page was missing.

BASIC > Alerts: Filtering for time was not possible.

The Barracuda Firewall is an application-aware network firewall appliance that leverages cloud resources to extend next-generation security and networking beyond the capabilities of typical security gateways or legacy firewalls. Barracuda Firewall offers enterprise-grade security

technology—including application control, user awareness, secure VPNs, link optimization, and advanced malware protection—but is designed for unsurpassed ease of use, and priced competitively. The Barracuda Cloud Control centralized management portal makes it easy and intuitive to deploy, configure, and manage the Barracuda Firewall from any location, and is included at no extra cost.

Complete Next-Generation Network Security

With integrated application and user visibility, along with support for multiple authentication methods and an optional local user database, the Barracuda Firewall enables highly granular policies defined by port, protocol, application, user, and time/date. For example, you might allow Skype chat at all times for everybody, but only allow Skype video at a certain time or for a certain user group. In addition, all models of the Barracuda Firewall protect unlimited IP addresses, and include an advanced intrusion prevention engine (IPS), as well as unlimited site-to-site and client-to-site secure VPN licenses.

Web Security in the Cloud

By moving CPU-intensive malware scanning and URL filtering tasks to the Barracuda Web Security cloud infrastructure, the Barracuda Firewall extends the capacity of on-premises computer resources. In addition, cloud integration ensures that signature libraries and threat definitions are always up-to-date. Even as whole new threat categories emerge, your protection continues without interruption — unlike that provided by legacy UTMs, which must be replaced each time they need to defend against a new kind of threat.

Link Optimization Technology

The Barracuda Firewall includes advanced link balancing and traffic shaping capabilities to optimize business continuity and to prioritize business-critical applications while throttling or blocking unproductive ones. Automatic link failover ensures uninterrupted connectivity even when a primary link fails—and with the optional Barracuda UMTS 3G modem, you'll stay connected even if a disaster cuts all the landlines.

Future-Proof Investment Protection

By leveraging effectively limitless cloud resources for content filtering and malware protection, even smaller Barracuda Firewall units are able to scale easily as traffic and user numbers increase. The Energize Updates subscription service ensures that definitions and signature libraries are always up to date, and cloud-delivered firmware updates deliver new capabilities as required to address a constantly evolving threat landscape—no matter when you purchase your Barracuda Firewall, you'll always have the latest version.

Simple Pricing with No Surprises

Every Barracuda Firewall unit is delivered with all features and capabilities fully enabled. Content filtering and advanced malware protection in the cloud is offered as an affordable per-box subscription. Neither the Barracuda Firewall nor the Web Security Service have any associated per-user license fees—once you purchase the box and the service, you can scale up to the appliance's maximum capacity at no further cost. And the simple, intuitive Barracuda Cloud Control management portal is included free of charge.

ADVANCED NETWORK SECURITY

In today's world of omnipresent botnets and other advanced threats, one of the main tasks of perimeter protection is to ensure ongoing availability of the network for legitimate requests and to filter out malicious denial of service (DoS) attacks. Barracuda Firewall achieves this via a series of advanced techniques:

- Barracuda Firewall DoS protection uses generic TCP proxy forwarding so that only legitimate TCP traffic gets into the network.
- Rate limits are applied to limit the number of sessions per source handled by the firewall. Packets arriving too quickly will simply be dropped.
- To prevent IP spoofing, the reverse routing path (RRP) to the packet's source IP address is checked. If the check uncovers a mismatch between incoming and reply interface, the packet is dropped.

APPLICATION CONTROL

Barracuda Firewall can identify and enforce policy on sophisticated applications that hide their traffic inside otherwise "safe" port/protocols such as HTTP or HTTPS.

For example, Skype and peer-to-peer (P2P) applications are particularly evasive, requiring advanced application control for policy enforcement. Barracuda Firewall enforces policies based on application, user, location, and time/date. Actions include blocking, allowing, throttling, or even enabling or disabling specific application features.

Application control is built into the kernel of the Barracuda Firewall, using a combination of deep packet inspection and behavioral analysis to reliably detect more than 900 applications.

IDENTITY AWARENESS

Within any organization, different individuals or groups require access to different resources and applications. For example, marketers may need to use Facebook for their work, while for other groups it will only waste time and bandwidth.

To enforce policies that control access to resources and allocation of bandwidth, Barracuda Firewall identifies users based on IP address mapping. Role assignments based on identity and device posture checks can be used within the firewall to facilitate role-based access control (RBAC).

Barracuda Firewall supports authentication of users and enforcement of user-aware firewall rules, content inspection, and application control using Active Directory, NTLM, MS CHAP, RADIUS, LDAP/LDAPS as well as authentication with x.509 certificates.

INTRUSION PREVENTION SYSTEM (IPS)

The Barracuda Firewall IPS is tightly integrated in the firewall architecture. It enhances network security by providing comprehensive real-time network protection against a broad range of network threats, vulnerabilities, exploits and exposures. It also keeps spyware and worms out of the corporate network in order to prevent fraud and to maintain strict privacy.

When an attack is detected, the Barracuda Firewall either drops the offending packets and sessions (while still allowing all other traffic to pass) or just logs the intrusion attempt. As part of the Energize Update subscription, signature updates are delivered in near real time as new exploits are identified, to ensure the Barracuda Firewall is constantly up-to-date and aware of the latest threats and vulnerabilities.

BARRACUDA WEB SECURITY SERVICE

By moving CPU-intensive malware scanning and URL filtering tasks to the Barracuda Web Security cloud infrastructure, the Barracuda Firewall extends the capacity of onpremises compute resources. With virtually unlimited cloud resources, the Barracuda Firewall has the elasticity to scale dynamically as security needs change. Reporting is also handled in the cloud, further improving resource efficiency.

In addition, cloud integration ensures that signature libraries and threat definitions are always up to date - even as whole new threat categories emerge, your protection continues without interruption, unlike that provided by legacy firewalls, which must be replaced each time they need to defend against a new kind of threat.

LINK OPTIMIZATION TECHNOLOGY

To ensure the best and most cost efficient connectivity, the Barracuda Firewall provides a wide range of built-in uplink options such as unlimited leased lines, up to six DHCP, up to four xDSL, and up to two ISDN and UMTS connections.

By eliminating the need to purchase additional devices for uplink balancing, security conscious customers will have access to a WAN connection that never goes down, even if one or two of the existing WAN uplinks are severed.

Automatic failover ensures the next best uplink is activated on the fly, and all traffic is rerouted to make full use of the remaining links. Predefined load balancing policies make it particularly easy to share the bandwidth of multiple uplinks, and can prioritize specific application traffic or assign it to a specific link.

CENTRALIZED MANAGEMENT VIA THE CLOUD

Every Barracuda Firewall is integrated with Barracuda Cloud Control (BCC), which allows organizations to manage all their Barracuda Firewalls (along with most other Barracuda Networks solutions) through a single, consistent interface. This gives administrators a global view of all of their devices and ensures they are provisioned with the latest firmware, definitions, and security policies.

Combined with the configuration of Barracuda Web Security settings and reporting, this allows effectively all security settings to be centrally managed via one interface available on every Internet-connected device. BCC is included at no charge with every Barracuda Firewall unit. Users may also choose to manage each device directly through its own interface.

Underlying Technology

Hardened Operating System

Security devices protecting the network at the perimeter need to be invulnerable to attacks. Barracuda Firewall is built on a hardened Linux operating system developed and optimized over the course of more than ten years. A customized infrastructure layer provides the basic gateway properties and routing capabilities already in the Linux kernel. The system is protected against attacks on the system itself as well as all application functions hosted by the system via the integration of a separate Barracuda Firewall-based host firewall, inspecting all incoming and outgoing local traffic from and to the system.

phion Core

Unlike other firewall products that simply enhance or augment standard Linux firewall packages, the core of every Barracuda Firewall is a specially developed application-controlled packet-forwarding firewall called the phion core. It is based on a combination of stateful packet forwarding, TCP stream forwarding, and application-layer gateways, enhanced by custom application plug-ins that handle complex protocols involving dynamic address or port negotiations.

The phion core technology delivers a best-of-both-worlds hybrid technology firewall that uses stateful packet forwarding as well as transparent circuit-level application proxying, and that provides generic interfaces for content scanning, bandwidth management, and VPN tunnel selection.

Getting Started

These instructions are an expanded version of the Barracuda Firewall Quick Start Guide that was shipped with your appliance. If you have already completed the steps in the Quick Start Guide to set up the Barracuda Firewall with a wizard, go to Step 3. Explore the Barracuda Firewall.

In this article:

- Step 1. Unpack the Barracuda Firewall
- Step 2. Set Up the Barracuda Firewall
 - · Test and Configure at my Desk Wizard
 - Protect my Network Wizard
 - Without a Wizard
- Step 3. Explore the Barracuda Firewall
 - Subscription Status
 - Firmware Update
 - Network
 - WAN Connectivity
 - Firewall
- Next Steps

Step 1. Unpack the Barracuda Firewall

Unpack the Barracuda Firewall and verify that you have all of the following accessories:

- Barracuda Firewall (verify that you have received the correct model)
- AC power cord
- Power supply (X100/X101/X200/X201 only)
- Wi-Fi antenna (X101/X201 only)
- Mounting brackets (X300 and above)
- Ethernet cable

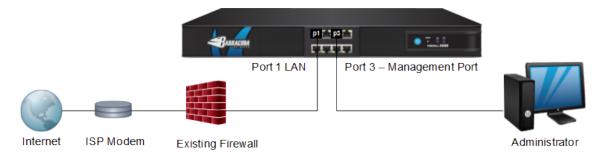

If any items are missing or damaged, contact your Barracuda sales representative.

Step 2. Set Up the Barracuda Firewall

After you unpack the Barracuda Firewall, you can choose to set it up with or without a wizard:

- Test and Configure at my Desk Wizard (Recommended) Evaluate and configure the Barracuda Firewall before production deployment with the **Test at my desk** wizard.
- Protect my Network Wizard Immediately replace an existing firewall or build a new network with the **Protect my network** wizard.
- Without a Wizard If you want to build your own setup or need a very specific configuration, you can also configure the Barracuda Firewall without a wizard.

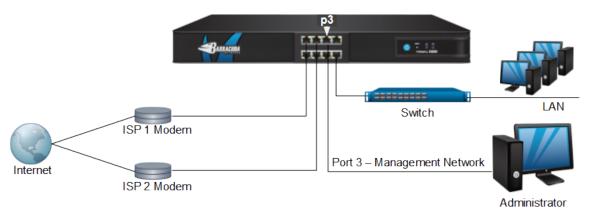

Test and Configure at my Desk Wizard

To set up the Barracuda Firewall with the **Test at my desk** wizard for evaluation:

- 1. Set up the unit between the management PC and the network.
- 2. Connect the LAN to port 1 and the management PC to port 3. The management PC can configure the Barracuda Firewall while still being connected to the LAN through the transparent port 1—port 3 bridge.
- 3. Go to https://192.168.200.200.
- 4. Continue at the certificate warning and log into the Barracuda Firewall (default username: admin, default password: admin).
- 5. Follow the instructions in the **Test at my desk** wizard.

Protect my Network Wizard

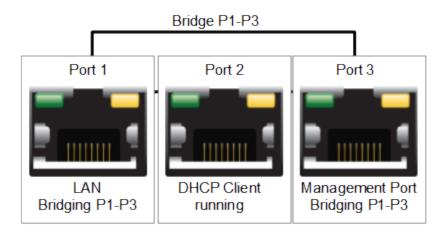

To deploy the Barracuda Firewall with the **Protect my network** wizard:

- 1. Connect the management PC to port 3.
- 2. Connect your ISP modems and LANs to the other available interfaces.
- 3. Go to https://192.168.200.200.
- 4. Continue at the certificate warning and log into the Barracuda Firewall (default username: admin, default password: admin).
- 5. Follow the instructions in the Protect my network wizard. The wizard helps you configure up to two ISPs and two LAN networks.

Without a Wizard

If you do not want to set up the Barracuda Firewall with a wizard, use the web interface. By default, the ports on the Barracuda Firewall are configured as follows:

- Port 1: LAN
- Port 2: DHCP client
- Port 3: Management port
- Port 1—Port 3 Bridge: Transparent network access for the management PC

Step 3. Explore the Barracuda Firewall

After setting up the Barracuda Firewall, explore the following areas to learn where to get necessary information for working with your firewall and its services:

Area	Description
Subscription Status	To verify the status of your licenses, go to the BASIC > Status page and view the Subscription Status section. The status for all purchased licenses displays as Current. While the Barracuda Firewall is connected to the Internet, it automatically downloads licenses. If the Barracuda Firewall cannot be activated, please contact Barracuda Technical Support.
Firmware Update	To verify that the Barracuda Firewall is using the latest available firmware, go to the ADVANCED > Firmware Update page. For production, use the latest general release firmware version. Before updating the appliance, read the release notes for information on new features and bug fixes.
Network	 Network Routes and Interfaces – Go to the NETWORK > Routing page. Network Interface Links – Go to the BASIC > Status page and mouse over the ports displayed in the Link Status section. To view the configurations of the following: Network Interfaces – Go to the NETWORK > IP Configuration p age and view the Network Interface Configuration section. Bridges – Go to the NETWORK > Bridging page. Before you deploy the Barracuda Firewall for production use, delete the port 1—port 3 bridge. For more information on networking, see Networking.
WAN Connectivity	Barracuda Firewall supports both static and dynamic WAN connections. If you completed the Protect my network wizard, you have at least one WAN connection configured. For more information, see How to Configure WAN Interfaces.

Firewall	To view firewall rules, go to the FIREWALL > Firewall Rules page. By default, the Barracuda Firewall includes preconfigured firewall rules that allow the following traffic:
	 All traffic from the management port (port 3) over the port 1—port 3 bridge. All traffic from trusted LAN networks to the Internet.
	Any disabled firewall rules are displayed in gray.
	To monitor currently active and recently completed connections, go to the following pages:
	 BASIC > Active Connections BASIC > Recent Connections
	For more information on the firewall and firewall rules, see Firewall.

Next Steps

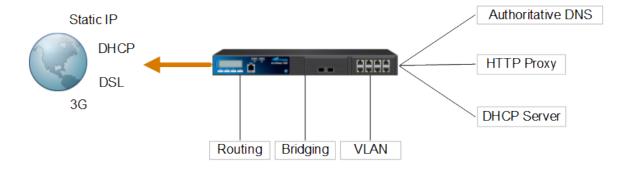

After setting up and exploring the Barracuda Firewall, you can complete the following tasks:

Task	Instructions
Connect the Barracuda Firewall to your existing authentication service or create a built-in database for user information.	Managing Users and Groups
If supported by your Barracuda Firewall (models X101 and X201), configure Wi-Fi.	How to Configure Wi-Fi
Configure a site-to-site VPN.	Site-to-Site VPN
Configure client-to-site VPN access.	Client-to-Site VPN
Link the Barracuda Firewall with your Barracuda Cloud Control account for central management and configuration.	How to Configure Barracuda Cloud Control
Configure the Barracuda Web Security Service, a cloud-based web filtering and security service.	How to Configure the Barracuda Web Security Service
Set up an authoritative DNS.	How to Configure Authoritative DNS
Configure a DMZ.	How to Configure a DMZ

Networking

From the **NETWORK** tab, you can view and configure the following basic network, connectivity, and service settings:

- Management IP Address, DNS, Static and Dynamic Interfaces, and Wi-Fi
- Network Routes
- Interface Groups
- Bridges
- DHCP Server
- Authoritative DNS
- Proxy

Management IP Address, DNS, Static and Dynamic Interfaces, and Wi-Fi

On the **NETWORK > IP Configuration** page, you can view a list of each network interface (static, dynamic, and virtual) that has been configured for the Barracuda Firewall. You can also configure the following basic network configurations:

IP Configuration	Description	Article
Management IP Address	The management IP address is used to administer and configure the Barracuda Firewall from a web browser.	Getting Started with the Barracuda Firewall
DNS Servers	The primary and secondary DNS server. You can also cache the DNS responses to speed up DNS queries.	Getting Started with the Barracuda Firewall
Static Interface	Static interfaces for static IP addresses and ranges.	How to Add a Static Network Interface
Dynamic Interface	Dynamic interfaces for DSL, DHCP, or 3G.	How to Configure WAN Interfaces
Virtual Interface	Virtual interfaces for VLANs. You must use properly configured 802.1q capable switches.	How to Configure a VLAN
Wi-Fi Link	If available for your Barracuda Firewall model, you can create up to three different Wi-Fi networks.	How to Configure Wi-Fi
3G Network Interface	With a Barracuda M10 3G/UMTS USB modem, you can configure 3G connectivity.	How to Configure a 3G Dial-In Connection

Network Routes

On the **NETWORK > Routing** page, you can add static routes. For more information, see How to Add a Static Route.

On the Routing page, you can also view the following tables for a list of network routes and network interfaces for the Barracuda Firewall:

Table	Description
Network Routes	This table contains all the routing information sorted by routing table. Routing information is processed from top to bottom.
Network Interfaces	This table contains all interfaces, their current state visualized by a graphical icon, and the IP addresses assigned to the interface.

Interface Groups

On the **NETWORK > Interface Groups** page, you can organize multiple interfaces belonging to the same network in interface groups. In firewall rules, the interface group specifies the source address that the interface is allowed to use.

For more information on interface groups, see Interface Groups.

Bridges

To transparently connect two networks, you can configure a bridge. For more information, see How to Configure a Bridge.

DHCP Server

Every Barracuda Firewall can act as a DHCP server. You can configure DHCP servers on a per-network basis. For more information, see How to Configure the DHCP Server.

Authoritative DNS

You can configure a split level and authoritative DNS server. For more information, see How to Configure an Authoritative DNS.

Proxy

To free the local firewall capabilities of the Barracuda Firewall, you can use the cloud resources of the Barracuda Web Security Service to intercept and scan all HTTP and HTTPS traffic for malware. To use this service, you must have an additional Barracuda Web Security subscription. You must also be connected to the Barracuda Cloud Control.

If you already have an ICP-enabled proxy server running in your network, see How to Configure a Forward Proxy.

How to Configure WAN Interfaces

By default, ports p2 and p3 are preconfigured. If you want to configure a WAN interface for either of these ports, you might need to remove the default configurations:

- Port p2 Initially, the network interface for port p2 is configured as a dynamic network interface named **DHCP**. If you want to configure either a static or other dynamic connection besides DHCP (PPTP or PPPoE) on port p2, delete the default **DHCP** interface.
- Port p3 Initially, port p3 is bridged to port p1. Both interfaces are also configured as management ports in the LAN. To use port p3 for another connection, delete the P1-P3 bridge. However you might lose connectivity to the network from your administrative PC.

After removing the default configurations for ports p2 and p3, you can reconfigure them as WAN interfaces. For any other ports, just begin configuring the WAN interface. You can configure the WAN interface with either static or dynamic IP address assignment.

Be sure to add the gateway to create the default route over the WAN interface, either when you add or edit a static network interface, or on the **NETWORK > Routing** page.

Related Articles

For examples on how to create more specific types of WAN interfaces, see the following articles:

- How to Configure a DHCP Connection
- How to Configure a PPPoE Connection
- Example Configuring a Static WAN Connection
- How to Configure a 3G Dial-In Connection
- Example Configuring a DMZ
- How to Configure Wi-Fi

If you want to use port p2 or p3, first remove their default configurations.

- 1. If you want to use port p2:
 - a. Go to the NETWORK > IP Configuration page.
 - b. Delete the default DHCP interface from the **Dynamic Interface Configuration** section.
- 2. If you want to use port p3:
 - a. Go the **NETWORK > Bridging** page and delete the P1-P3 bridge.
 - b. Go the the FIREWALL > Firewall Rules page. Delete the P1-P3-BRIDGE firewall rule.

Configure a WAN Interface

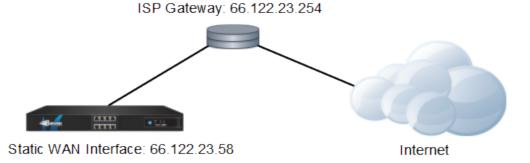

To configure a WAN interface:

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. If your WAN interface has a static IP address:
 - a. In the Static Interface Configuration section, click Add Static Network Interface.
 - b. Configure the static interface settings, including the gateway address.
 - c. Click Add.
- 3. If you have a dynamic connection such as PPTP or PPPoE:
 - a. In the Dynamic Interface Configuration section, click Add Dynamic Network Interface.
 - b. Configure the dynamic interface settings.
 - c. Click Add.
- 4. At the top of the page, click on the warning message to execute the new network configuration.

Example - Configuring a Static WAN Connection

This article provides example settings to configure an interface for an ISP that statically assigns an IP address for a WAN uplink. For instructions on how to configure a static network interface, see How to Add a Static Network Interface.

The static WAN interface and ISP gateway for this example are shown in the following figure:

The interface must be configured on port p4 with an IP address of 69.122.23.58 and a netmask of 255.255.255.0 (or /24). The default gateway of the ISP is 69.122.23.254.

Configure the static network interface with the following settings:

Setting	Value
Network Interface	Select p4.
IP Address	Enter 69.122.23.58.
Netmask	Enter 255.255.25.0.
Classification	Click WAN.
Gateway	Enter 69.122.23.254.

How to Configure a PPPoE Connection

Follow these instructions if your WAN interface is provided using PPPoE. This protocol is typically used by ISPs that offer DSL. If your ISP provides a modem, connect the Ethernet port of the modem to a free network interface of your Barracuda Firewall. Use the Ethernet cable that is delivered with the modem. If a cable was not delivered with the modem, please clarify if the modem must be connected to another device with a standard Ethernet cable or a crossover cable.

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the Dynamic Interface Configuration section, click Add Dynamic Network Interface.
- 3. From the **Network Interface** list, select the network interface that the ISP modem is connected to on the Barracuda Firewall.
- 4. Enter a name for the new connection.
- 5. Select the following settings:
 - Network Protocol: PPPoE
 - Classification: WAN
- 6. Configure the remaining settings for your network requirements.
 - If your dial-in connection requires Synchronous PPP mode, select the check box. If you are not sure which mode to use, contact your ISP.
 - For the initial configuration, keep the default Metric value of 100. In a multiprovider configuration, the Barracuda Firewall
 chooses the interface with the lowest metric for outgoing traffic.
 - You can make the Barracuda Firewall reachable with a unique identifier (DNS-resolvable name). For **Use Dynamic DNS**, select **Yes** and enter your DynDNS credentials. For more information on the DynDNS service, see http://dyn.com/dns/🛂.
 - You can manually start and stop the link. For Connection Start Method, select Manual. To control the link, go to the Dynamic Network Interfaces section of the NETWORK > Interfaces page.
 - To monitor the Internet connection, select a type of Health Check to perform. Most ISPs support LCP to continuously monitor
 successful data transmission. However, you can use ICMP requests for monitoring the Internet connection. If you use ICMP for
 link monitoring, add a target IP address to the Health Check Target list.
- 7. Click Add.
- 8. At the top of the page, click on the warning message to execute the new network configuration.
- 9. After committing your changes, log back into the Barracuda Firewall.

How to Configure a 3G Dial-In Connection

To establish wireless Internet connections, you can install the external Barracuda M10 USB modem on the Barracuda Firewall. 3G connections are ideal for backup lines and for use in mobile offices or locations without terrestrial Internet links.

After you connect the Barracuda M10 USB modem to the Barracuda Firewall, configure the provider settings. Then verify that the default network route and network interface of the 3G WAN link have been successfully introduced and are available.

In this article:

- Step 1. Connect the Barracuda M10 Modem
- Step 2. Configure the Provider Settings
- Step 3. Verify the Uplink and Default Network Route

Step 1. Connect the Barracuda M10 Modem

To connect the Barracuda M10 modem:

- 1. Follow the steps in the Barracuda M10 3G Modem Quick Start Guide to insert the SIM card into the Barracuda M10 USB modem.
- 2. Connect the Barracuda M10 modem to an empty USB port of the Barracuda Firewall.
- 3. Connect the antenna to the Barracuda M10 modem and place it in a stable location.
- 4. Restart your Barracuda Firewall so that it recognizes the Barracuda M10 modem.
 - a. Go to the BASIC > Administration page.
 - b. In the System Reload/Shutdown section, click Restart.

Step 2. Configure the Provider Settings

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the **3G Network Interface** section, select the following settings:
 - Enable 3G Network Interface: Yes
 - Classification: WAN
- 3. Configure the remaining **3G Network Interface** settings for your network requirements.
 - You can configure the Barracuda M10 modem to automatically choose the transmission standard with the best transmission performance. For Radio Preference, click Auto.
 - For the initial configuration, keep the default Metric value of 400. In a multiprovider configuration, the Barracuda Firewall

- chooses the interface with the lowest metric for outgoing traffic.
- If authentication is required, enter the username and password for establishing a connection to your ISP. If authentication is not required, select the No Auth check box.
- If a pin number is required to unlock your SIM card, enter it in the SIM PIN field.
- To use the DNS server that is assigned by your ISP, set Use Assigned DNS to Yes. The Barracuda Firewall then uses the DNS servers of the ISP for DNS requests.
- To make the Barracuda Firewall reachable with a unique identifier (DNS-resolvable name), set Use Assigned DNS to Yes and
 enter your DynDNS credentials.

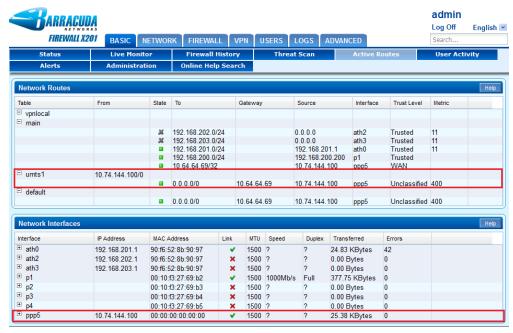

For more information on the DynDNS service, see http://dyn.com/dns/14.

- To start the link automatically, set Connection Start Method to Automatic.
- To manually start and stop the link, set Connection Start Method to Manual. To control the link, go to the Dynamic Network Interfaces section of the NETWORK > Interfaces page.
- To monitor the 3G Internet connection, select a test type from the Health Check list. Most ISPs support LCP to continuously
 monitor successful data transmission. However, you can use ICMP requests for monitoring the Internet connection. If you use
 ICMP for link monitoring, add a target IP address to the Health Check Target list.
- 4. Click Save Changes.
- 5. At the top of the page, click on the warning message to execute the new network configuration.
- 6. After committing your changes, log back into the Barracuda Firewall.
- 7. To verify that the Barracuda M10 modem can establish a connection to your ISP, check its status LED lights. For information on the meaning of the LED lights, see the Barracuda M10 USB Modem Quick Start Guide.

Step 3. Verify the Uplink and Default Network Route

Verify that the Barracuda Firewall can establish an Internet connection and that the default network route was introduced.

- 1. Go to the **BASIC** > Active Routes page.
- 2. In the Network Routes section, verify that a default network route for the 3G WAN link was introduced.
- 3. In the Network Interfaces section, verify that the network interface of the 3G WAN link is available.

How to Configure a DHCP Connection

If the IP address is dynamically assigned by your ISP, follow the instructions in this article to configure the interface.

Before You Begin

If your ISP provides a modem, connect the Ethernet port of the modem to a free network interface on the back of your Barracuda Firewall. Use the Ethernet cable that is delivered with the modem. If a cable was not delivered with the modem, determine if the modem must be connected to

another device with a standard Ethernet cable or a crossover cable.

Configure the WAN Interface

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the Dynamic Interface Configuration section, click Add Dynamic Network Interface.
- 3. Enter a name for the new connection.
- 4. Set Network Protocol to DHCP.
- 5. From the Network Interface list, select the network interface that the ISP modem is connected to on the Barracuda Firewall.
- 6. Set Classification to WAN.
- 7. Configure the remaining settings for your network requirements.
 - In the MTU field, enter the MTU size. If the MTU size is too large, network packets passing the ISP line are fragmented and might decrease the performance of your network performance. For the correct MTU size, contact your ISP.
 - To automatically introduce a network route for this Internet connection, set Create Default Route to Yes.
 - For the initial configuration, keep the default Metric value of 100. In a multiprovider configuration, the Barracuda Firewall
 chooses the interface with the lowest metric for outgoing traffic.
 - To use the DNS server that is assigned by your ISP, set Use Assigned DNS to Yes. The Barracuda Firewall then uses the DNS servers of the ISP for DNS requests.
 - To make the Barracuda Firewall reachable with a unique identifier (DNS-resolvable name), set Use Dynamic DNS to Yes and enter your DynDNS credentials.

For more information about the DynDNS service, visit http://dyn.com/dns/\$\overline{\omega}\$.

- Specify the **Connection Timeout** for this link. The connection timeout specifies the time in seconds that the Barracuda Firewall waits for an IP address to be assigned. If the defined limit is exceeded, the link is marked as unreachable.
- To start the link automatically, set Connection Start Method to Automatic.
- To manually start and stop the link, set Connection Start Method to Manual. To control the link, go to the Dynamic Network Interfaces section of the NETWORK > Interfaces page.
- To add IP addresses to monitor the Internet connection beyond the gateway, add a target IP address to the Health Check Target list.
- Click Add
- 9. At the top of the page, click on the warning message to execute the new network configuration.
- 10. After committing your changes, log back into the Barracuda Firewall.

How to Add a Static Network Interface

Follow the instructions in this article to configure a static network interface. You can add a subnet to a free physical or virtual interface.

Barracuda Firewall

To configure a static network interface:

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the Static Interface Configuration section, click Add Static Network Interface.
- 3. In the Add Static Network Interface window, configure the settings for the network interface.
 - From the Classification list, you can select the following options to specify if the network is added to a network object:
 - Unclassified The network is not added to any network objects.
 - Trusted The network is added to the Trusted LAN network object.
 - DMZ The network is added to the DMZ Networks network object.
 - WAN The network is added to the Internet network object.

- If you do not enter a **Gateway**, the default gateway (0.0.0.0) is used.
- 4. Click Add.
- 5. At the top of the page, click on the warning message to execute the new network configuration.

How to Configure Wi-Fi

The Barracuda Firewall X101 and X201 are equipped with a Wi-Fi network module supporting IEEE 802.11 b/g/n with a maximum transmission rate of 54 Mbps and 108 Mbps in SuperG mode for compatible client devices. Using WPA and WPA2 with a RADIUS authentication server, you can encrypt wireless networks. The Barracuda Firewall can serve up to three independent Wi-Fi networks with different SSIDs. You can configure each Wi-Fi network with a landing page serving either a confirmation message or a ticketing system for guest network access.

In this article:

- Step 1. Configure the Wi-Fi Interface
- Step 2. Configure the Wi-Fi Settings
 - · Configure the Radio
 - Configure a Wi-Fi Access Point
- Step 3. Enable the DHCP Server
- Step 4. Configure the Firewall Rule for Wi-Fi
- Step 5. Verify the Order of the Rules in the Rule Set

Step 1. Configure the Wi-Fi Interface

To configure basic network settings for the Wi-Fi module:

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the **Static Interface Configuration** section, edit one of the available Wi-Fi interfaces (ath0, ath2, ath3) if you want to change the IP address configuration.
- 3. Click Save.

Step 2. Configure the Wi-Fi Settings

When the static Wi-Fi network interface is available, Wi-Fi can be activated. The SSID, wireless security, and authentication can also be adjusted.

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the Wi-Fi Link Configuration section, select the Activate WiFi check box to enable Wi-Fi.
- 3. From the Location list, select the country that your Barracuda Firewall is located in.
- 4. Click Save Changes.

Configure the Radio

To configure the radio channel and transmission rate:

- 1. Click Configure Radio and edit the radio settings.
 - For more transmission power and a bigger range of radio reception, select a higher mW value from the Power list.
 - For higher data throughput, select a higher **Mbps** value from the **Bitrate** list.
 - To bond two channels for a transmission rate of up to 108 Mbps, set SuperG to Yes. When you enable this setting, verify that all
 clients connecting to this access point support SuperG mode.
- 2. Click Save Changes.
- 3. At the top of the page, click the warning message to execute the new network configuration.
- 4. Log into the Barracuda Firewall again.

Configure a Wi-Fi Access Point

To edit a Wi-Fi access point:

- 1. Click Edit for the access point you want to enable (WIFI, WIFI2, WIFI3).
- 2. In the SSID field, enter the Service Set IDentifier (SSID). This name is displayed to Wi-Fi clients that search for available Wi-Fi signals.
- 3. From the Security Level list, select one of the following options:
 - High WPA2 (Recommended).
 - Medium WPA.
 - None No encryption.
- 4. From the Authentication list, select one of the following options:

- WPA-PSK Use this option when key management should be done locally on the Barracuda Firewall. Then define a preshared key.
- WPA-RADIUS/EAP Use this option when key management is done by a RADIUS server. Then enter the RADIUS server information into the RADIUS Configuration section.
- 5. To forward clients to a landing page that displays a **Confirmation Message** or serves a **Ticketing** system, enable the feature. To give clients direct access to the Wi-Fi network, select **None**.
- 6. Click Save.

With firmware version 6.1.0 and above, you can edit the landing page and ticketing settings, as well as add or remove guest networks. To configure these settings, go to the **USERS > Guest Access** page.

Step 3. Enable the DHCP Server

To assign IP addresses to clients that are connected to the Wi-Fi network, enable the DHCP server of the Barracuda Firewall.

- 1. Go to the NETWORK > DHCP Server page. Clients with an active lease are listed in the Active Leases section.
- 2. In the DHCP Server section, set Enable DHCP Server to Yes.
- 3. If you change the network configuration of the default wifi and wifi2 interfaces, modify the available subnets or create a new one.
- 4. Click Save Changes.

Step 4. Configure the Firewall Rule for Wi-Fi

There is a predefined firewall rule named WIFI-2-INTERNET that only applies to the first Wi-Fi network (ath0). To allow other networks, you can either edit a copy of the rule for the other networks or edit the rule directly to include all subnets.

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. To edit a copy of the WIFI-2-INTERNET rule:
 - a. Copy the WIFI-2-INTERNET rule. The rule copy is created at the bottom of the rule set.
 - b. Edit the WIFI-2-INTERNET-COPY rule.
 - c. Click the Advanced tab and change Interface Group to WIFI2 or WIFI3.
- 3. To directly edit the the WIFI-2-INTERNET rule to include all subnets:
 - a. Edit the WIFI-2-INTERNET rule.
 - b. Click the Advanced tab and select Matching from the Interface Group list.
 - c. Click the **General** tab and change **Source** to specify the Wi-Fi subnets.
- 4. At the top of the rule editor window, click Save.

Step 5. Verify the Order of the Rules in the Rule Set

Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. Also verify that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

How to Configure a VLAN

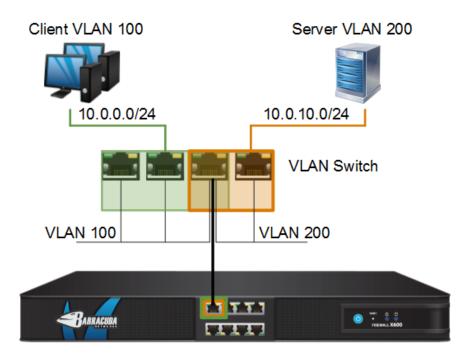

You must have a properly configured 802.1q-capable switch to support VLANs.

You can use VLANs to simulate several LANs on one physical network interface (but only one MAC address). The physical interface behaves as if it were several interfaces, and the switch behaves as if it were multiple switches. VLANs let multiple virtual networks share switches, cables, and routers. All VLANs created on a host interface share the bandwidth of the physical interface. However, you can configure bandwidth policies (QoS) to specify how much bandwidth an interface can use.

In this article:

- Create a Virtual Interface
- Next Steps

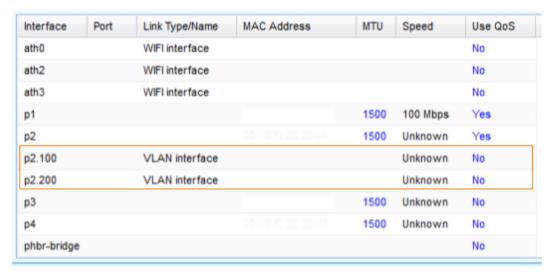

Create a Virtual Interface

To add a VLAN:

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the Virtual Interface Configuration section, add an entry for the VLAN. In the VLAN configuration, you can only select a host interface that is capable of supporting VLANs and connected to a correctly configured VLAN switch.
- 3. Click Save Changes.
- 4. At the top of the page, click on the warning message to execute the new network configuration. It can take up to two minutes for the settings to be applied.

The VLAN interface then appears in the **Network Interface Configuration** section. VLAN interface names are displayed in this format:

p<port number>.<vlan id>

Next Steps

After adding the virtual interface, you can use it in your network configurations as if it were a physical interface. Continue with any of the following network configuration articles:

- How to Add a Static Network Interface
- · How to Add a Static Route

- · How to Configure a Bridge
- How to Configure Bandwidth Policies (QoS)

How to Add a Static Route

Static routes are used to specify a gateway for an unassociated network so that the return traffic can take the correct path. In general, you must add a static route when you want to reach networks that are not directly attached to the Barracuda Firewall or the default gateway.

To add a static route:

- 1. Go to the **NETWORK > Routing** page.
- 2. Enter the settings for your static route.
- 3. Click Add.
- 4. At the top of the page, click on the warning message to execute the new network configuration.

For more information on the static route settings, click Help on the page.

How to Configure a Bridge

To transparently connect two networks, you can configure Layer 2 bridging on the Barracuda Firewall. For example:

- · You can bridge a wireless network with one of your local networks.
- · If you have servers with external IP addresses, you can bridge that traffic with the ISP gateway.

After configuring your bridge, create a firewall rule to allow traffic between both networks.

To help you configure the bridge, you can use the pre-installed bridge between ports p1 and p3 and the predefined firewall rule for the bridge.

In this article:

- Step 1. Configure the Bridge
- · Step 2. Create a Firewall Rule for the Bridge
- Port p1—Port p3 Bridge

Step 1. Configure the Bridge

Before you begin:

Verify that least one interface has a static route configured.

To configure the bridge:

- 1. Go to the **NETWORK > Bridging** page.
- 2. Click Add Bridged Group.
- 3. Enter a name for the bridge and add the interfaces to be bridged.
- 4. Commit this change.

Step 2. Create a Firewall Rule for the Bridge

To create the firewall rule:

- 1. Go to FIREWALL > Firewall Rules page.
- 2. Create a firewall rule to allow the traffic between the bridged networks. For example, if you are bridging servers with external IP addresses with the ISP gateway, create a rule that only allows traffic on port 443 and port 80 to pass.
- 3. Verify the order of the firewall rules. Because rules are processed from top to bottom in the rule set, ensure that you arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

 After adjusting the order of rules in the rule set, click **Save Changes**.

Port p1—Port p3 Bridge

To aid you in evaluation and initial setup, the Barracuda Firewall has a pre-installed bridge between ports p1 and p3. You can see the bridge on the **NETWORK > Bridging** page. The firewall rule that allows all traffic to pass between ports P1 and P3 is called P1-P3-BRIDGE. That rule has the following settings:

Action	Source	Destination	Service	Bi-directional	Interface Group	Connection

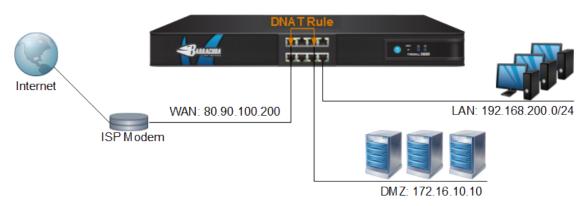

Allow	Port-p1	Port-p3	Any	Yes	Matching (matches all	No SNAT (original source
					interfaces)	IP address is used)

How to Configure a DMZ

In some cases, you might want to redirect network traffic from the Internet to a network host residing in a network segment protected by the Barracuda Firewall. For example, you have a web server hosting a website that is reachable through the Internet. For additional security, you can put the web server in the DMZ segment to logically separate hosts in the DMZ from other hosts in different network segments.

With a DMZ configuration, you have full control over network traffic from the Internet to the web server, as well as traffic from other network segments to the web server. This configuration might be necessary if hosts from other network segments must access the same web server.

If your web server listens on TCP port 8080 instead of 80 and you do not want to change the listening socket of your web server, you can use the Port Address Translation (PAT) feature of the DNAT rule to modify the destination port of IP packets passing the Barracuda Firewall. In the **Redir ect To** field of the rule settings, append the port to be translated to the IP address field (e.g., 172.16.10.1:8080).

In this article:

- Step 1. Configure the Interface
- Step 2. Configure the Firewall Rule
- Step 3. Verify the Order of the Firewall Rules

Step 1. Configure the Interface

Create a network segment (e.g., 172.16.10.0/24 on port 3).

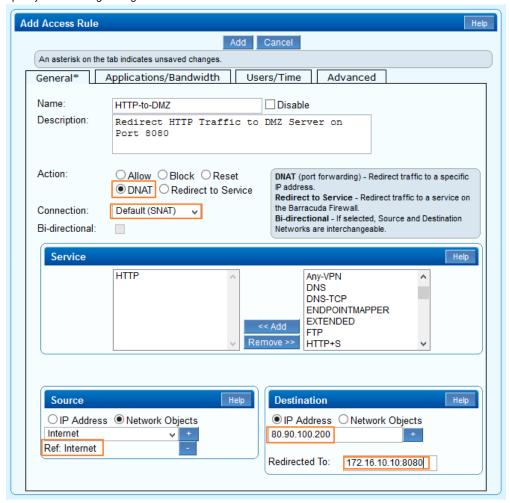

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the Static Interface Configuration section, click Add Static Network Interface.
- 3. Enter a name into the Name field.
- 4. Specify the following settings:
 - Network Interface Select the interface connected to the DMZ (e.g., p3).
 - IP Address Enter the interface IP address for the DMZ (e.g., 172.16.10.1). This IP address represents the default gateway for clients within this network segment.
 - Netmask Enter the netmask (e.g., 255.255.255.0).
 - Classification Select DMZ.
- 5. Click Save Changes.
- 6. At the top of the page, click on the warning message to execute the new network configuration.

Step 2. Configure the Firewall Rule

Create a firewall rule that allows HTTP traffic from the Internet to the web server residing in the DMZ.

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Click Add Access Rule to create a new firewall rule.

- 3. In the Add Access Rule window, enter a name and description for the rule.
- 4. Specify the following settings:

- Action Click DNAT.
- Connection Select Default (SNAT).
- Service Add the service objects to redirect (e.g., HTTP).
- Source Click Network Objects and add Internet.
- Destination Click IP Address field and enter the WAN address (e.g., 80.90.100.200).
- Redirected To Enter the IP address and port number of the DMZ server (e.g., 172.16.10.10:8080).
- 5. At the top of the Add Access Rule window, click Add.

Step 3. Verify the Order of the Firewall Rules

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, you must arrange your rules in the correct order. Ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

How to Configure the DHCP Server

If enabled, the Barracuda Firewall DHCP server automatically assigns IP addresses to clients that reside in a defined subnet. This article provides an example of how to configure a DHCP server on the Barracuda Firewall.

In this article:

- Step 1. Enable the DHCP Server
- Step 2. Configure the DHCP Server Subnet
- Step 3. Configure the Client
- Step 4. (Optional) Assign Static IP Addresses
- Monitoring Active Leases

Step 1. Enable the DHCP Server

To enable the DHCP server:

- 1. Go to the **NETWORK > DHCP Server** page.
- 2. In the DHCP Server section, select Yes to enable the DHCP server.
- 3. Click Save Changes.

To use the DHCP server within the management network, go to the **NETWORK > IP Configuration** page and add a secondary IP address in the **Management IP Configuration** section.

Step 2. Configure the DHCP Server Subnet

This example configures a DHCP server subnet named LAN that uses an IP range from 192.168.200.150 to 192.168.200.160, subnet mask of 255.255.255.0, and an NTP server at ntp.barracudacentral.com.

- 1. In the Add DHCP Server Subnet section, specify the following settings:
 - Name: LAN
 - Beginning IP Address: 192.168.200.150
 - Ending IP Address: 192.168.200.160
 - Subnet Mask: 255.255.255.0
 - **Gateway**: 192.168.200.200
 - DNS Server 1: Enter your DNS server.
 - NTP Server 1: ntp.barracudacentral.com
- 2. If required, specify the Default Lease Time and Maximum Lease Time.
- 3. If you use WINS servers in your network, enter their IP addresses in the WINS Server 1 and WINS Server 2 fields.
- 4. Click Add Subnet.

Step 3. Configure the Client

The DHCP server is now ready to assign DHCP leases to connected clients. For clients that currently have manually assigned IP addresses, reconfigure them to receive IP addresses from the DHCP server.

Step 4. (Optional) Assign Static IP Addresses

After enabling and configuring the DHCP server, you can also assign static or fixed IP addresses to designated hosts (such as servers in your network).

To assign a static IP address to a system:

- 1. In the DHCP Server Subnets section, click Edit under the Action tab.
- 2. In the Static Leases section, edit the following settings:
 - $\bullet \ \ \text{Hostname} \colon \text{Enter a name for the system to be assigned a static address. For example, $\mathtt{Workstation}.$$
 - MAC Address: Enter the MAC address of the selected system. You can also copy the MAC address from the Active Leases se
 ction.
 - IP Address: Enter the IP address that you want to assign to the system. Click the plus sign (+) next to the address line to assign the address to the system.
- 3. Click Save Subnet.

In the Active Leases section of the DHCP Server window, the IP address lease is displayed as Static.

Monitoring Active Leases

In the Active Leases section, you can monitor active DHCP leases. The information for each lease is displayed in the following columns:

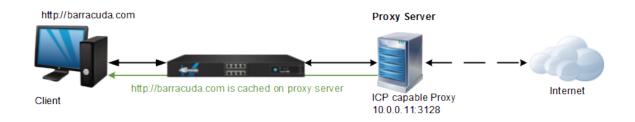

Column	Description
Range	The IP range of the subnet.
Hostname	The hostname of the Windows client.
IP Address	The percentage of actively used IP addresses from the range.

State	The current state of the lease pool and the number of addresses that are in use.
Start	The start lease time of the IP address range.
End	The end lease time of the IP address range.
MAC Address	The MAC address of the Windows client.
Туре	The type of the IP address. The IP address can be either Static or Dy namic .

How to Configure a Forward Proxy

If your network has a proxy or you want to use an ISP proxy, you can configure a forward proxy.

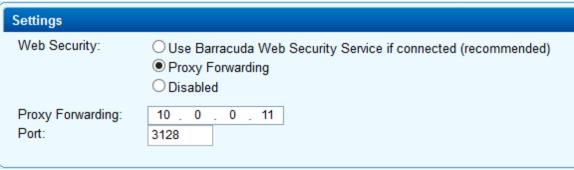

This article provides steps and example settings to configure a forward proxy for the setup that is illustrated in the following figure:

Configure a Forward Proxy

- 1. Go to the **NETWORK > Proxy** page.
- 2. Configure the following settings:
 - Web Security: Select Proxy Forwarding.
 - Proxy Forwarding: Enter the IP address of the forward proxy.
 - Port: Enter the port of the forward proxy. Default values are 3128 or 8080.

For example, if you are configuring a forward proxy for the setup in the figure above:

3. Click Save Changes.

How to Configure Authoritative DNS

The Barracuda Firewall can act as an authoritative DNS server, returning definitive answers to DNS queries about domain names installed in its configuration. With DNS, you can:

- Use the the same namespace internally and externally. You can direct external clients to use one IP address, and internal clients to use an internal path to the same hostname. This feature is also called Split DNS.
- Use inbound link balancing to increase the availability of any name-based services that you are hosting (such as web servers, VPNs, and email hosts).

In this article:

- Split DNS
- · Inbound Link Balancing and Failover
- Configuring Authoritative DNS
- How Authoritative DNS Works
- DNS Zone Transfer Blocking
- · Add a WAN Interface After the Domains are Created
- Zones and Domains

Related Articles

- DNS Records
- How to Configure an Authoritative DNS Host

Split DNS

The Barracuda Firewall supports a split DNS infrastructure. If the same hostname is used for a resource that is both internally and externally accessible, internal network clients receive the internal IP address and external clients receive the external IP address when they ask for the address of that hostname. Specifically, the A record for the hostname includes two views: one with the internal IP address and one with the external IP address. Clients only see the address that they should use. For more details on how to configure split DNS, see "Step 3: Set up DNS for Internal Clients" in How to Configure an Authoritative DNS Host.

If local clients use external IP addresses to access internal servers, the Barracuda Firewall translates the address and forwards those requests to internal servers.

Inbound Link Balancing and Failover

Authoritative DNS lets you define one or more domains that are accessible via more than one WAN interface. When asked to resolve a host, the Barracuda Firewall returns one of the IP addresses of the available WAN interfaces. Using authoritative DNS provides two benefits:

- Failover If one interface goes down, the domain is still available via one of the other interfaces.
- Incoming link balancing Incoming traffic to the domain is spread across all the interfaces that you configure for that domain.

Only WAN interfaces with static IP addresses can be advertised to respond to DNS queries. However, you can accept traffic on any of your WAN interfaces for a domain configured on the Barracuda Firewall. DNS resource records describe the hosts and name servers and other attributes of the domain. Following the instructions provided here and using the web interface of the Barracuda Firewall, you can create the records that describe the domain or domains that are hosted on the LAN side of the Barracuda Firewall. The supported DNS resource records are described in DNS Records.

Configuring Authoritative DNS

For an overview of the steps required to make the Barracuda Firewall an authoritative DNS host, see How to Configure an Authoritative DNS Host

How Authoritative DNS Works

By configuring the Barracuda Firewall as the authoritative DNS server for the domains that are behind it, you increase the availability of your hosted servers. When asked for the IP address of a hostname, the Barracuda Firewall returns a DNS A record that contains the IP address of one of your WAN interfaces.

Every DNS record has a Time to Live (TTL) value, which is the length of time that the DNS record can be cached. For most DNS records, two days is a typical and acceptable value. However, A records should have a very short TTL, such as 30 seconds. If a WAN interface fails, its address is no longer returned. The inbound traffic to this host will not be disrupted because the cached address for the failed interface will time out quickly. Specifying a short TTL for A records also assists in link balancing. Because the address for a host that is returned varies among the available links, the short TTL guarantees that the interface used for incoming traffic directed to that host also varies frequently.

When asked for the A record, the Barracuda Firewall rotates through the list of IP addresses, varying which IP address appears first in the returned list according to the inbound link balancing algorithm. That address can be cached by clients for no longer than the value specified in TTL. This has two benefits:

- Inbound traffic is shared among multiple interfaces.
- If a link fails, its address is no longer returned so the inbound traffic to this host will not be disrupted. A short TTL value for this record ensures that the cached address for the failed interface times out quickly.

DNS Zone Transfer Blocking

The Barracuda Firewall can be configured to block zone transfers on some or all of the domains that it hosts. An AXFR/IXFR query that is sent from another DNS server to the Barracuda Firewall (to request a copy of the DNS records) is rejected if zone transfers are disabled for that domain. By default, zone transfers are enabled for all domains created.

Add a WAN Interface After the Domains are Created

After creating your domains, you can add new WAN interfaces for DNS queries (static interfaces only) and inbound link balancing. To add such an interface:

- Go to the NETWORK > IP Configuration page and add the interface with the DNS Server service enabled (if you want it to be used to respond to DNS queries).
- 2. Go to the **NETWORK > Authoritative DNS** page.
- 3. If this is a static interface and you want it to be used to respond to DNS queries:
 - For each domain that is already defined, add a new NS record and a new A record to each domain for the new interface.
- 4. Edit the A records for your servers to enable inbound traffic to be received on the new interface for the corresponding internal servers. When you edit the A record, you can select the new WAN interface from the **Links** list and add it to the A record.

Zones and Domains

A domain name server stores information about part of the domain name space called a zone. All names in a given zone share the same domain suffix. For example, if **barracuda.com** is the domain suffix, **mail.barracuda.com** and **eng.barracuda.com** are possible subdomains. These can be all served by one domain name server or some of the subdomains can be delegated to other domain name servers. Every domain or subdomain is in exactly one zone. Rather than make a distinction between a zone and a domain, the web interface of the Barracuda Firewall simply asks you to create a domain.

DNS Records

In this article:

- · DNS Records Generated when Creating a Domain
- Additional DNS Records

DNS Records Generated when Creating a Domain

When you create a domain on the Barracuda Firewall, the following records are automatically generated:

Record	Description
Start of Authority (SOA)	The SOA record defines the global settings for the hosted domain or zone. Only one SOA record is allowed per hosted domain or zone.
Name Server (NS)	NS records specify the authoritative name servers for this domain. One NS record for each name server in the DNS Servers table is generated.
Address (A)	A records map a hostname to an IP address. Each host inside the domain should be represented by an A record. One A record is created for each name server in the DNS Servers table. An A record is also created for each matching domain name found in 1:1 NAT and Port Forwarding rules.

Additional DNS Records

After a zone has been created, you can edit its records or add NS records, A records, and any of the following records to the zone:

Record	Description
Mail Exchanger (MX)	MX records point to the email servers that are responsible for handling email for a given domain. There should be an MX record for each email server, including any backup email servers. If an email server lies within the domain, it requires an A record for each name server. If the email server is outside the domain, specify the FQDN of the server, ending with a dot. Example: mail.my-isp.net
Text (TXT)	Text records allow text to be associated with a name. This can be used to specify Sender Policy Framework (SPF) or DomainKeys records for the domain.
Canonical Name (CNAME)	A CNAME record provides a mapping between this alias and the true, or canonical, hostname of the computer. It is commonly used to hide changes to the internal DNS structure. External users can use an unchanging alias while the internal names are updated. If the real server is outside the domain, specify the FQDN of the server, ending with a dot. Example: server1.my-isp.net
	If a domain name has a CNAME record associated with it, then it cannot have any other record types. Do not use CNAME defined hostnames in MX records.
Service (SRV)	Service records are used to store the location of newer protocols, such as SIP, LDAP, IMAP, and HTTP.
Pointer (PTR)	PTR records point to a canonical name. The most common use is to provide a way to associate a domain name with an IP address.
Other (OTHER)	Use an OTHER record to add a type of DNS record that is not supported, such as NAPTR.

More information about these records and their attributes can be found in the online help.

Back to How to Configure Authoritative DNS.

How to Configure an Authoritative DNS Host

To make the Barracuda Firewall an authoritative DNS host, complete the following steps:

Step	Explanation
Step 1. Enable Authoritative DNS on the Barracuda Firewall	Enable the DNS Server service on the links and the service on the Barracuda Firewall.
Step 2. Create One or More Domains	Define one or more domains on the Barracuda Firewall.
Step 3. Set up DNS for Internal Clients (Split DNS)	Make your internal DNS server forward queries to the Barracuda Firewall. Configure split DNS.
Step 4. Add More DNS Records	Add more DNS records for web servers and email servers.
Step 5. Update Your Domain Registrar	Tell the Internet that your domain exists or has changed.
Step 6. Test	Test external access.

Step 1. Enable Authoritative DNS on the Barracuda Firewall

Go to the **NETWORK > Authoritative DNS** page and enable **Authoritative DNS**. In the **DNS Servers** table, you can view a list of the links that are configured with the DNS Server service on the **NETWORK > IP Configuration** page.

Step 2. Create One or More Domains

To define a domain:

- 1. On the **NETWORK > Authoritative DNS** page, click **Add New Domain**.
- 2. Enter the domain name, and define TTL and zone transfer settings.
- 3. Click Create.

The following records are created:

- Start of Authority (SOA) Only one SOA record is allowed per hosted domain or zone.
- Name Server (NS) One NS record for each name server in the DNS Servers table is generated.
- Address (A) One A record is created for each name server in the DNS Servers table.

The DNS records are created with typical default values. To view and edit all of the values for each record, click **Edit** next to the record in the **DN S Records** section.

To configure more than one external IP address for a domain:

On the **NETWORK > Authoritative DNS** page, edit the A record for the hostname. On the dialog that appears, in the **IP Addresses** table, specify the **IP** addresses to be used in response to external DNS queries.

The **IP Addresses** table is the list of IP addresses which can be used to reach this host name. When asked for the A record, the Barracuda Firewall rotates through this list of IP addresses, varying which IP address appears first in the returned list in round robin fashion. If an interface is not available, its IP address is not returned in the list.

Add multiple IP addresses to achieve inbound link balancing and failover. Enter **Local Network** IP addresses, if they exist, for internal DNS queries (more about this in Step 3).

For each external IP address, in the **Links** column, select the WAN link from the drop-down list. Enter the address in the **WAN IP Address** field. Click the plus sign (+) to add the entry. Save your changes when complete.

Step 3. Set up DNS for Internal Clients (Split DNS)

The Barracuda Firewall supports a split DNS infrastructure. If you are using the same domain name for internally and externally accessible resources, internal (trusted) network clients receive the internal IP address of the resource and external clients receive the external address. To direct internal and external requests to different IP addresses for the same namespace:

- 1. On the NETWORK > IP Configuration page, add (or verify that you have added) a static trusted interface with the DNS Server service.
- 2. For each hostname that is used both internally and externally, add one or more internal addresses:
 - a. On the **NETWORK > Authoritative DNS** page, edit the A record for the hostname.
 - b. On the dialog that appears, in the **IP Addresses** table, specify the local IP addresses to be used in response to internal DNS queries. For each local address:
 - i. In the Links column, select INTERNAL ONLY to use a local IP address for this host name.
 - ii. In the Local Network column, type the local IP address for this host name.
 - iii. Click +.
 - iv. Save your changes when complete.
- 3. If you have an internal DNS server, configure it to forward queries to the interface in step 1.
- 4. Using an internal network client, try to access each hostname and verify that you are directed to the correct site.

Step 4. Add More DNS Records

Add more DNS records to your domains to match your configuration. For example, each email server needs an MX record and a corresponding A record. Each web server needs an A record.

If you have externally reachable IP addresses that are not tied to any interface, such as ARIN networks, create an A record for each one. In the Li nks list, select ANY.

Step 5. Update Your Domain Registrar

If you have not registered your domain name, register it with a domain name registrar like GoDaddy.com or register.com. Make the NS records of the domain point to your static WAN IP addresses. If your domain name is already registered, contact your registrar to update the NS records of the domain to point to your static WAN IP addresses. Remove records that reference any domains that are now delegated to the Barracuda Firewall.

Hosting a Subdomain

If your domain is hosted at your ISP or elsewhere and you want to delegate a subdomain to be resolved by the Barracuda Firewall, add some records to the zone file of the domain where it is stored at the registrar. If the domain is example.com, and you want to host my.example.com and you have two name servers named ns1 and ns2, add these lines, using the actual IP addresses of your name servers:

```
my IN NS ns1
my IN NS ns2
ns1 IN A 216.101.241.181
ns2 IN A 192.0.2.2
```

Step 6. Test

From a host on the Internet, run **nslookup** on your domain names and verify that the expected IP addresses are returned. Depending on the change and how long the various resolvers cache DNS responses, it might take some time for your changes to be noted throughout the Internet. For example, it might take a day before a new domain name is accessible via the Internet. If a domain name was previously registered and the DNS record is modified, any server on the Internet that has the previous information will not get the update until the TTL of the original record has passed.

Back to How to Configure Authoritative DNS.

How to Change the Management IP Address and Network Interface of a Barracuda Firewall

Use the management IP address to configure and administer your Barracuda Firewall from a web browser. As part of the configuration steps detailed in the Barracuda Firewall Quick Start Guide (available for download on the Barracuda Firewall - Overview page), you should have set the management IP address to its initial value, using network interface p1.

To change the management IP address and interface:

- 1. In a web browser, go to https://<current management IP address>.
- 2. Log into the web interface with the username and password that you have configured.
- 3. Go to the **NETWORK > IP Configuration** page.
- 4. In the Management IP Configuration section, select a new Management Interface.
- 5. Enter the new Management IP Address and Management Netmask.
- 6. Select the Ping and/or NTP check boxes if you also want this interface to respond to those requests.
- 7. Click Save Changes.
- 8. At the top of the page, click on the warning message to execute the new network configuration. It may take up to two minutes for the settings to be applied.

Use the new management IP address when you log into the web interface:

https://<new management IP address>

How to Configure and Use High Availability

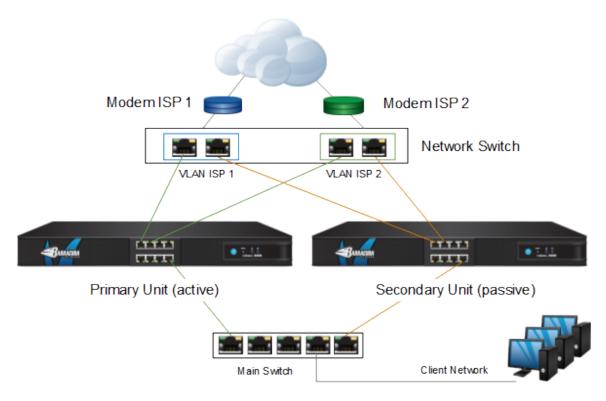

Version Info

This feature is available in firmware version 6.1.0 and later.

For redundancy and reliability, you can set up two Barracuda Firewalls in a high availability (HA) cluster. During normal operations, the primary unit is active while the secondary unit waits in standby mode. The secondary unit has the same configurations as the primary unit, and it only becomes available when the primary unit is down. The failover is reversed when the primary unit can resume operations.

To execute a failover when a unit or networking component becomes unavailable, you can configure the monitoring of additional IP addresses and interfaces. You can also manually execute a failover.

When installing two Barracuda Firewalls in a high availability cluster, ensure that the cabling is done exactly the same on both units. The management IP addresses must also be configured on the same ports. For example, if port 3 on the primary box is connected to ISP 1, the secondary box must also connect port 3 with ISP 1. If you install cabling incorrectly, HA failover does not work properly. For an example of correct cabling, see the following diagram:

In this article:

- Enable High Availability
- Configure Monitoring
- Verify the HA Status
- · Manually Execute an HA Failover

Enable High Availability

Before you set up two Barracuda Firewalls in an HA cluster, ensure that both units fulfill the following prerequisites:

- Both Barracuda Firewalls must be the same model type and revision. They must also run the same firmware version.
- The management IP addresses of both units must be in the same network and subnet.
- · System clocks and timezones must be accurately set on both units. If they are not, HA pairing can fail.

To enable the HA cluster:

- 1. Log into the secondary unit.
- 2. Go to the ADVANCED > High Availability page.
- 3. In the Setup section, click Enable High Availability.
- 4. In the Enable High Availability window, enter the management IP address, serial number, and administrator password for the primary
- 5. Click **Enable**. The HA pairing process can take several minutes. During this process, do not reload the configuration page or configure any other settings.

After the HA pairing is successful, the **Disable High Availability** option appears in place of the **Enable High Availability** option. The IP addresses and serial numbers of both HA units are also displayed.

Additionally, this warning message is displayed on every configuration page of the secondary unit:

While the secondary unit is part of the HA cluster, you can only configure the following settings:

- ADVANCED > High Availability
- NETWORK > IP Configuration > Management IP Configuration
- NETWORK > IP Configuration > Dynamic Interface Configuration
- (If 3G is available) NETWORK > IP Configuration > 3G Network Interface

Configure Monitoring

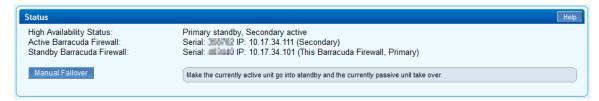

You can configure the monitoring of additional IP addresses and interfaces. If these IP addresses and interfaces become unreachable, a failover is executed.

On the ADVANCED > High Availability page, in the Monitoring section, add the Reachable IPs and Reachable Interfaces.

Verify the HA Status

To verify the HA status of the Barracuda Firewall, go to the **ADVANCED > High Availability** page and see the **Status** section. This section indicates if the appliance is active, standby, primary, or secondary. If the appliance is not part of an HA cluster, this section indicates that it is **Stan d-Alone**.

This figure shows an example of the status for a primary unit in standby mode:

This figure shows an example of the status for a secondary unit that is currently active:

①

On the **BASIC > Status** page, you can also view the current HA status in the **Services** section. To see the status details, hover over **Hi gh Availability**.

Manually Execute an HA Failover

On the ADVANCED > High Availability page, you can manually execute an HA failover by clicking Manual Failover in the Status section.

If the Barracuda Firewall is not part of an HA cluster, the Manual Failover option is disabled.

Firewall

You can manage network traffic between untrusted and trusted network segments using object-based firewall rules. Even as your network grows, firewall objects make it easy to manage services, hosts, and network segments. The firewall rules are processed from top to bottom to see if the network traffic matches the criteria specified in them. The first matching rule is executed. Criteria for matching are one or more of:

- · Source IP address or network
- Destination IP address or network
- Service (protocol, port/range)
- Application
- Users

- Time
- Interface

Additionally, Intrusion Prevention, SYN flood protection, and a limit on the number of sessions per source IP address can be enforced.

To create, edit, or change the order of firewall rules, go to the **FIREWALL > Firewall Rules** page. For more about matching criteria and possible firewall rule actions, see Firewall Rules. If you are new to the Barracuda Firewall, see Pre-Installed Firewall Rules to review the rules that are already set up in the appliance. You can use these preinstalled rules as a starting point for your own rules.

Firewall Rules

This article provides an overview of the parameters that you can define for firewall rules.

In this article:

- About Firewall Rule Objects
- · Attributes of Firewall Rules
- · Applications/Bandwidth
- Users/Time
- Advanced

About Firewall Rule Objects

In the Barracuda Firewall, a firewall object is a named collection that represents specific networks, services, or connections. Using firewall objects gives you the following advantages:

- · Each object has a unique name that is more easily referenced than an IP address or a network range.
- Maintenance of the firewall rules is simplified. When you update a firewall object, the change is automatically updated in every rule that
 uses the object.

Attributes of Firewall Rules

Each firewall rule has the following attributes:

- Name The name of the firewall rule. This name is displayed on the BASIC > Active Connections, BASIC > Recent Connections, an
 d BASIC > IPS Events pages.
- Description An additional description field for the firewall rule.

Action – Specifies how the Barracuda Firewall handles network traffic that matches the criteria of the rule. The following table gives you
a detailed overview of each available action:

Action	Description
Allow	The Barracuda Firewall passes all network traffic that matches the firewall rule.
Block	The Barracuda Firewall ignores all network traffic that matches the firewall rule and does not answer to any packet from this particular network session.
Reset	The Barracuda Firewall dismisses all network traffic that matches the firewall rule. Matching network sessions are terminated by replying TCP-RST for TCP requests, ICMP Port Unreachable fo r UDP requests, and ICMP Denied by Filter for other IP protocols.
DNAT	The Barracuda Firewall rewrites the destination IP address or network to a predefined network address.
Redirect to Service	The Barracuda Firewall redirects the traffic locally to one of the following services that are running on the Barracuda Firewall: Caching DNS, SIP Proxy, HTTP Proxy, VPN, or NTP.

• Connection – Defines the egress interface and source (NAT) IP address for traffic matching the firewall rule. If a source IP address is specified, the appropriate link is selected from the routing table. If an interface is specified, the appropriate source IP address is selected from the routing table. You can also create connection objects, as described in How to Create a Connection Object. For example, multiple source IP addresses and interfaces can be specified in the same connection object. This allows failover or session-based balancing between up to four links. Balancing can be achieved using either a round robin or weighted random algorithm. The following table lists the predefined connection objects:

Predefined Connection Object	Description
Default (SNAT)	Change the source IP address of network packets to the IP address of the interface with the lowest metric according to the routing table.
No SNAT	Connection is established using the original source IP address. Use if simple routing with NAT is desired.
SNAT with DSL IP	Source NAT with the IP address of the DSL uplink.
SNAT with 3G IP	Source NAT with the IP address of the 3G uplink.
SNAT with DHCP IP	Source NAT with the IP address of the DHCP uplink.

- Service Describes the protocol and port/port range of the matching traffic. You can define one or more services for the firewall rule. You can select a predefined service object or create your own service objects on the FIREWALL > Service Objects page.
- Source The source IP address/netmask of the connection that is affected by the rule. You can select a network object or explicitly enter
 a specific IP address/netmask. You can create network objects on the FIREWALL > Network Objects page.
- **Destination** The destination IP address/netmask of the connection that is affected by the rule. You can select a network object or explicitly enter a specific IP address/netmask.

Applications/Bandwidth

You can also configure bandwidth and application policies.

- Bandwidth policies protect the available overall bandwidth of an ISP uplink line. Network traffic can be classified and throttled within each
 firewall rule. To adjust the overall bandwidth of each network interface, go to the NETWORK > IP Configuration page. There are eight
 predefined bandwidth policies. For additional information, see How to Configure Bandwidth Policies (QoS).
- · Application policies regulate how this session is treated by the Barracuda Firewall if certain network traffic is detected by the application

- filter. Traffic can be reported, dropped, or throttled.
- The application filter identifies the type of traffic that you want to limit or control. The application-aware filter detects peer-to-peer client
 applications (such as IM, peer-to-peer based file sharing, and Skype) that usually cannot be detected by pattern-based
 intrusion prevention mechanisms.

Users/Time

For more granular control, you can configure firewall rules that are only applied to specific users or during specific times.

- Users can be used as a criteria for the rule. Users can be managed locally at the Barracuda Firewall or through several external
 authentication services like MS Active Directory, NTLM, LDAP, RADIUS, OCSP, or the Barracuda DC Agent. To create users objects, go
 to the FIREWALL > User Objects page.
- Administrators can create firewall rules that are only active for specific times or dates. For example, you can create a time object that
 includes Mondays and the hours of 8:00 am to 9:00 am. You can apply this time object to a rule so that traffic is only passed during these
 times. You can also create a time object that includes the lunch hour and apply it to a firewall rule that allows web browsing with a higher
 bandwidth policy. To create new time objects, go to the FIREWALL > Time Objects page.

Advanced

You can also configure the following advanced firewall settings:

• Interface Group – For each rule, an interface can be assigned to the origin of the connection request. The interface group specifies the interface that the source address is allowed to use. The following table describes each available interface group:

Interface Group	Description
Matching	Ensures that arriving packets are processed through the same interface, which forwards the corresponding reply packets. Source and destination addresses are thus only reversed. This method helps prevent a network attack in which an attacker might try using internal addresses from outside the internal network (IP spoofing).
Any	Uses the first interface matching the request, in accordance with the routing configuration. The packet source is not verified. Reply packets might be forwarded through another interface, if multiple interfaces capable of doing so are available. In very special configurations, checking the physical source of packets cannot be required.
DSL/DHCP	Explicitly restricts rule processing to the specified dynamic network interface (if installed and configured).
WIFI/WIFI2/WIFI3	Explicitly restricts rule processing to the specified Wi-Fi network interface (if installed and configured).
VPNClients	Explicitly restricts rule processing to the specified virtual network interface of a VPN client (if installed and configured).
3G	Explicitly restricts rule processing to the specified 3G network interface (if installed and configured).

• SYN Flood Protection – SYN flood protection protects from a popular kind of DoS attack against computer systems. The Barracuda Firewall can eliminate SYN flooding attacks for inbound or outbound attacks. The firewall completes the handshake and only then performs a handshake with the actual target. This helps to protect the target from SYN flood attacks. Disabling SYN flood protection can cause an overhead in packet transmission but can speed up interactive protocols like SSH.

Firewall Rules Order

You can view the firewall rules on the **FIREWALL > Firewall Rules** page. The firewall rules are processed from top to bottom to determine if the traffic matches the criteria. Because the first matching rule is executed to handle the network traffic, ensure that you arrange your rules in the correct order.

To change the order of the firewall rules:

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Drag rules up or down in the table. If you want a rule to be executed, drag it above the BLOCKALL rule.
- 3. After you finish adjusting the order of the firewall rules, click Save Changes. Otherwise, your changes will not take effect.

Pre-Installed Firewall Rules

The Barracuda Firewall comes with a set of pre-installed firewall rules. Initially, you can use the appliance without any changes to these rules. Eventually, you might want to customize the rules or enable the pre-installed rules that are disabled initially. Understanding the pre-installed rules can help you create your own rules.

On the FIREWALL > Firewall Rules page, you can view the following pre-installed firewall rules:

- P1-P3-BRIDGE
- LAN-2-BARRACUDA-SERVERS
- LOCALDNSCACHE-WIFI
- LOCALDNSCACHE
- TRANSPARENT-PROXY-WIFI
- TRANSPARENT-PROXY
- LAN-2-INTERNET-SIP
- INTERNET-2-LAN-SIP
- LAN-2-INTERNET
- WIFI-2-INTERNET
- LAN-2-LAN
- VPNCLIENTS-2-LAN
- WIFI-2-LAN
- BLOCKALL

P1-P3-BRIDGE

This rule creates a bridge between port p1 and port p3. All traffic passes between the two ports. The rule is useful when you first get the Barracuda Firewall and want to evaluate the appliance at your desk. Follow the instructions in the Barracuda Firewall Quick Start Guide to connect port p1 to the LAN and port p3 to your PC. This configuration gives the Barracuda Firewall access to the Internet, lets you look at traffic, and lets you continue to use your PC for other purposes during the evaluation period.

When you are finished with your evaluation and move the Barracuda Firewall into production, you can delete this rule.

LAN-2-BARRACUDA-SERVERS

This rule allows the traffic from the trusted LAN to reach the Barracuda Networks update servers. The rule is required for initial activation as well as ongoing firmware and security updates.

LOCALDNSCACHE-WIFI

This rule automatically redirects all DNS requests from a separate Wi-Fi network on interface ath0 to the local caching DNS service of the Barracuda Firewall. The rule is useful for reducing the amount of DNS traffic over the WAN connection and improving DNS resolution speed as well as security.

If you configure a DNS server in your local network, create a firewall rule that allows TCP and UDP traffic on port 53 from the IP addresses of your local DNS servers to the Internet. Place this rule above the LOCALDNSCACHE and LOCALDNSCACHE-WIFI rules.

LOCALDNSCACHE

This rule automatically redirects all DNS requests from the trusted LAN to the local caching DNS service of the Barracuda Firewall. The rule is useful for reducing the amount of DNS traffic over the WAN connection and improving DNS resolution speed as well as security.

If you configure a DNS server in your local network, create a firewall rule that allows TCP and UDP traffic on port 53 from the IP addresses of your local DNS servers to the Internet. You should place this rule above the LOCALDNSCACHE and LOCALDNSCACHE-WIFI rules.

TRANSPARENT-PROXY-WIFI

If enabled, this rule automatically redirects all HTTP requests on TCP port 80 from a separate Wi-Fi network on interface ath0 to the local proxy of the Barracuda Firewall. Depending on the proxy configuration (**NETWORK** > **Proxy**), web traffic is either scanned by Barracuda Web Security Flex or forwarded to a different proxy service.

TRANSPARENT-PROXY

If enabled, this rule automatically redirects all HTTP requests on TCP port 80 to the local proxy of the Barracuda Firewall. Depending on the proxy configuration (**NETWORK > Proxy**), web traffic is either scanned by Barracuda Web Security Flex or forwarded to a different proxy service.

LAN-2-INTERNET-SIP

If enabled, this rule automatically redirects all SIP requests from the trusted LAN to the local SIP proxy. It allows SIP communication through the Barracuda Firewall.

INTERNET-2-LAN-SIP

If enabled, this rule automatically redirects all SIP requests from any IP address to the local SIP proxy. It allows SIP communication from the Internet through the Barracuda Firewall.

LAN-2-INTERNET

This rule allows network traffic for all types of data from the trusted LAN to the Internet. It allows unrestricted access to the Internet for all hosts within the trusted LAN segment.

WIFI-2-INTERNET

This rule allows traffic from the Wi-Fi network coming in through interface ath0 unrestricted access to the Internet.

LAN-2-LAN

This rule allows network traffic for all types of data from one trusted LAN to another. It allows unrestricted network traffic between hosts residing in different LAN segments that are classified as trusted.

VPNCLIENTS-2-LAN

This rule allows unrestricted access for VPN clients coming in through interface pvpn0 to the trusted LAN. This includes PPTP-based access.

WIFI-2-LAN

This rule allows unrestricted access from the Wi-Fi network coming in through interface ath0 to the trusted LAN.

BLOCKALL

This rule blocks all incoming and outgoing network traffic that is not handled by the firewall rules that are placed above it in the rule set.

Connection Objects

The connection object defines the egress interface and source (NAT) IP address for traffic matching the firewall rule. If a source IP address is specified, the appropriate link will be used based on the routing table. If an interface is specified, the appropriate source IP address will be used based on the routing table.

You can use the predefined connection objects or you can create connection objects.

In this article:

- Define a Connection Object
- Predefined Connection Objects
- · Failover and Link Load Balancing
- Example HTTP and HTTPS Traffic to the Internet

Define a Connection Object

To add or edit new connection objects, go to the FIREWALL > Connection Objects page. Connection objects include the following settings:

ting	Description
------	-------------

Connection Timeout	The time in seconds to allow before a failing connection skips to the next fallback level. For a faster failover, enter lower values. For congested connections, enter longer values. Default: 30.
NAT Type	The type of NAT to use. The availability of the following settings depends on the NAT type that you select. This setting lets you specify which source IP address and interface are to be used in case of fallback. This is especially important if you are using multiple ISPs. Connecting via the backup provider using the wrong source IP address causes the return traffic routing to fail. Select one of these options:
	 Dynamic Source NAT – The firewall uses the routing table to find a suitable interface for routing the packet and uses the IP address of the relevant interface as the new source IP address. No Source NAT – The original source IP address of the packet is not changed. From Interface – Source NAT using the first IP address on the interface that is selected from the Interface list. Explicit – Uses the IP address that is entered in the Explicit IP Address field.
Proxy ARP	If the explicitly defined IP address does not exist locally, select this check box to create an appropriate Proxy ARP entry. This option is only available if Explicit has been chosen as NAT Type . Proxy ARP makes it possible for ARP requests to be answered for IP addresses that are not implemented in the Barracuda Firewall.
PAT	Uses Port Address Translation (PAT). PAT is also known as NAT overloading. PAT extends NAT so that port numbers are also translated. Use it to pool several private IP addresses to one public IP address. PAT can be enabled or disabled if you select either From Interface or Explicit from the NAT Type list. It is always enabled for Dynamic Source NAT and it is always disabled for No Source NAT.
Weight	Assigns a weight number to this interface. This is only used if the Multilink Policy selected in the Failover and Load Balancing section is Weighted Round Robin . Specify the value relative to the weights assigned to the other interfaces. A higher value means that this interface is used proportionally more.

Predefined Connection Objects

Name	Description
Name	Description
Default (SNAT)	Source NAT using the local IP address obtained from a routing lookup to the destination.
No SNAT	Connection is established using the original source IP address.
SNAT with DSL IP	Source NAT using the first IP address found on DSL interface ppp1.
SNAT with 3G IP	Source NAT using the first IP address found on 3G interface ppp5.
SNAT with DHCP IP	Source NAT using the first IP address found on interface dhcp.

Failover and Link Load Balancing

Multiple source IP addresses and interfaces can be specified in the same connection object. This allows failover or session-based balancing between up to four links. Balancing can be achieved using either a round robin or weighted random algorithm. For more information, see Exampl e - Creating Connection Objects for Failover and Link Balancing.

Example - HTTP and HTTPS Traffic to the Internet

To allow HTTP and HTTPS connections from the local 192.168.200.0/24 network to the Internet, the Barracuda Firewall must perform source-based NAT. Instead of using the source IP address from the client residing in the LAN, the connection is established between the WAN IP address of the Barracuda Firewall and the destination IP address. Reply packets belonging to this session are replaced with the client's IP address within the LAN.

For this example, use the predefined **Default (SNAT)** connection object. It automatically uses the WAN IP address of the ISP uplink with the lowest metric according to the Barracuda Firewall's routing table.

Interface Groups

In a firewall rule, the interface group specifies the interface that the source address is allowed to use. The following table describes the predefined interface groups:

Interface Group	Description
Matching	Ensures that arriving packets are processed through the same interface that is used to forward the corresponding reply packets. The source and destination addresses are the same. This method helps prevent a network attack in which an attacker might try using internal addresses from outside the internal network (IP spoofing).
Any	Uses the first interface matching the request, according to the routing table. The packet source is not verified. Reply packets might be forwarded through another interface, if another interface that is capable of doing so is available. In very special configurations, checking the physical source of packets cannot be required. For security reasons, this option should only be used in very limited situations.
DSL/DHCP	Explicitly restricts rule processing to the specified dynamic network interface (if installed and configured).
WIFI/WIFI2/WIFI3	Explicitly restricts rule processing to the specified Wi-Fi network interface (if installed and configured).
VPNClients	Explicitly restricts rule processing to the specified virtual network interface of a VPN client (if installed and configured).
3G	Explicitly restricts rule processing to the specified 3G network interface (if installed and configured).

On the NETWORK > Interface Groups page, you can see the existing interface groups and create new groups.

Link Balancing

On the Barracuda Firewall, you can configure inbound link balancing, outbound link balancing, and inbound load balancing. Link balancing is also sometimes called "link aggregation."

In this article:

- Inbound Link Balancing
- Outbound Link Balancing
- Inbound Load Balancing

Inbound Link Balancing

You can use DNS to balance inbound traffic among multiple links. You can associate your domain name (or names) with multiple IP addresses, each of which represents an external interface. When the DNS request for the domain name is resolved, all of these IP addresses are included in the answer. The resolver can vary the order of the addresses, and the requester uses the first entry in the list to access your site.

You can either register your domain name with an independent entity or you can configure the Barracuda Firewall as the authoritative DNS

resolver for the domain name. To learn more about authoritative DNS on the Barracuda Firewall, see How to Configure Authoritative DNS.

Outbound Link Balancing

To achieve outbound link load balancing, create a connection object that balances the traffic among multiple links. Then use this connection object in the firewall rules that direct outgoing traffic.

The connection object specifies what happens if multiple links are configured. Options include:

- If one interface becomes unavailable, then the traffic fails over to the next available link in the sequence.
- Use a set of interfaces in weighted-round robin fashion. You can specify the weights for each interface in the connection object.
- · Randomly choose one of a list of interfaces.

For more information about configuring connection objects, see Example - Creating Connection Objects for Failover and Link Balancing.

Inbound Load Balancing

To configure inbound load balancing (for example, where traffic is distributed to one of many servers), you can create a DNAT firewall rule that redirects traffic that was sent to a specific IP address to a load balancer.

Intrusion Prevention System (IPS)

To report and instantly block suspicious network traffic from passing the Barracuda Firewall, the Intrusion Prevention System (IPS) actively scans forwarded network traffic for malicious activities and known attack patterns. The IPS engine analyzes network traffic and continuously compares the bitstream with its internal signature database for known attack patterns. To increase security, the IPS system offers TCP stream reassembly to prevent IP datagram fragmentation before packets are scanned for vulnerabilities. The IPS engine can also inspect HTML requests passing the firewall.

IPS must be globally enabled on a Barracuda Firewall. However, you can enable or disable IPS for each firewall rule. Enabling IPS on a per-rule basis lets you select which network traffic is scanned for threats. For example, you can choose to enable IPS scanning only for network traffic that travels from and to the DMZ. When IPS is enabled in a firewall rule, the default IPS policy of Report Mode or Enforce Mode is used. In Report Mode, the Barracuda Firewall reports detected attacks instead of immediately blocking network traffic. This mode is recommended after the initial deployment of IPS to prevent traffic from being incorrectly blocked. However, you can prevent false positives when the IPS engine operates in Enforce Mode by creating IPS exceptions.

In this article:

- Enable and Configure IPS
 - Step 1. Enable IPS
 - Step 2. Adjust the Event Policy
 - Step 3. Configure IPS in Firewall Rules
- Configure IPS Exceptions

Enable and Configure IPS

To enable and configure IPS, complete the following steps:

Step 1. Enable IPS

To enable IPS on the Barracuda Firewall:

- 1. Go to the FIREWALL > Intrusion Prevention page.
- 2. In the Intrusion Prevention section, set Enable Intrusion Prevention System to Yes.
- 3. Configure the **Enable** and **Default IPS Policy** settings.
- 4. Click Save Changes.

Step 2. Adjust the Event Policy

On the FIREWALL > Intrusion Prevention page, in the Event Policy section, define the actions to be taken when the IPS engine detects suspicious network traffic with the following threat levels: Critical, High, Medium, Low, and Information. When the Barracuda Firewall operates in Report Mode, you can only adjust the Log settings. When the firewall operates in Enforce Mode, you can also modify the Action for each severity.

Available Action settings include:

- Drop Blocks network traffic where malicious activities were detected.
- Log Only Reports network traffic where malicious activities were detected.
- None No action is taken.

Available Log settings include:

- Alert
- Warn
- Notice

You can view detected threats on the BASIC > IPS Events page.

Step 3. Configure IPS in Firewall Rules

To configure IPS in a firewall rule:

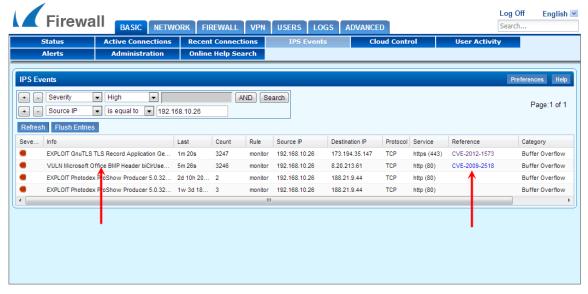

- 1. Go to the **FIREWALL > Firewall Rules** page.
- 2. Open an existing rule or create a new one.
- 3. In the Add/Edit Access Rule window, click the Advanced tab.
- 4. Next to Intrusion Prevention, select an option to disable or enable IPS:
 - Default (Report Mode or Enforce Mode) Applies the default IPS policy to the rule.
 - Disabled Disables IPS scanning for the rule.
- 5. Click Save.

Configure IPS Exceptions

If you must allow network traffic that the Barracuda Firewall has detected as a threat, you can create an IPS exception.

Before you create the IPS exception, get the description or CVE-ID of the threat:

- 1. Go to the BASIC > IPS Events page.
- 2. Browse through the list of detected threats or apply filters to locate specific entries.

3. Get the attack description text in the Info column, or, if available, the CVE-ID of the detected threat.

To create the IPS exception:

- 1. Go to the ADVANCED > IPS Exceptions page.
- 2. Click Add IPS Exception.
- 3. In the IPS Exceptions window, specify the traffic to be handled and the action to be performed by the exception.
- 4. Click Add.

How to Control Traffic for Applications

To block, allow, report, or throttle network traffic for specific application types, enable Application Control. It uses Layer 7 deep packet inspection to detect and prioritize traffic for services like instant messaging, social networking, or video streaming. It can even detect applications that try to evade pattern-based detection mechanisms by port-hopping, protocol obfuscation, or traffic encryption.

You can select the following policies to control traffic:

Application Detection Policy	Description
Limit Bandwidth	Limits the bandwidth of traffic. Depending on the QoS band that you select, traffic is either slowed down or choked. Choking traffic assigns 0.1% of the available bandwidth to the application, making it unusably slow without sending connection error messages to users. For more information on QoS, see How to Configure Bandwidth Policies (QoS).
Drop	Drops the connection and displays an error message stating that the connection is not possible or has been denied.
Report All	Lists detected applications on the BASIC > Recent Connections pa ge.

Follow the instructions in this article to enable Application Control and then configure it in firewall rules.

In this article:

- Step 1. Enable Application Control
- Step 2. Configure the Firewall Rule
- Step 3. Verify the Order of the Firewall Rules
- Monitoring Traffic for Controlled Applications

Step 1. Enable Application Control

To block application traffic, you must first enable Application Control and define the default policy.

- 1. Go to the **FIREWALL > Settings** page.
- 2. Select the following settings in the Firewall Policy Settings section:
 - Enable Application Detection: Yes
 - Default Application Detection Policy: Drop | Report All | Limit Bandwidth
- 3. Click Save Changes.

Step 2. Configure the Firewall Rule

After you enable Application Control, configure firewall rules with the filter patterns for the applications that you want to limit or block. The pre-installed LAN-2-INTERNET firewall rule allows network traffic for all types of data from the trusted LAN to the Internet. You can edit the LAN-2-INTERNET rule or create a new firewall rule if required.

Because Application Control can impact the performance of the Barracuda Firewall, be as specific as possible with firewall rule settings.

To edit the LAN-2-INTERNET rule:

- 1. Go to the **FIREWALL > Firewall Rules** page.
- 2. Edit the LAN-2-INTERNET firewall rule.

LAN-2-INTERNET Default Settings:

Action	Source	Destination	Service	Interface Group	Connection
Allow	Trusted LAN	Internet	Any	Matching (matches all interfaces)	SNAT (Source NAT using local IP address obtained from a routing lookup to the destination)

- 3. In the Edit Access Rule window, click the Applications/Bandwidth tab and configure the following settings:
 - Applications Policy Select one of the following policies:
 - Default (Default Application Detection Policy)
 - Report All Report on the BASIC > IPS Events page.
 - Limit Bandwidth (Default Bandwidth Policy) The Default Bandwidth Policy can be changed using the FIREWALL >
 Settings page. By default, this is set to Choke, i.e., to give the unwanted applications just enough bandwidth that they
 will not seek another way to send traffic.
 - **Drop** Do not pass the traffic.
 - Application Filter Add the applications that you want to apply the rule to.
 - To create a rule for video streams, such as YouTube videos, add STREAM-FLASH.
 - To create a rule for Facebook, add STD-FACEBOOK.
 - To create a rule for Skype, add IM-SKYPE_AUDIO, IM-SKYPE_OUT, and P2P-SKYPE.
- 4. Click Save. A "Configuration updated" message displays at the top of the Firewall Rules page.

Step 3. Verify the Order of the Firewall Rules

Because rules are processed from top to bottom, arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of the rules, click Save Changes.

Monitoring Traffic for Controlled Applications

To view blocked or throttled connections, go to the **BASIC > Recent Connections** page. In the **Service** column for each connection, the controlled application is listed. To view specific connections, you can filter the list of recent connections.

How to Create User-Aware Firewall Rules

To control traffic for certain users, you can configure a user-aware firewall rule. First, create a user object that includes the users whose traffic you want to control. Because users are included by their login names or authentication groups, ensure that you have set up your external or local authentication method. After creating the user object, apply it to the firewall rule.

In this article:

- Step 1. Create a User Object
- · Step 2. Apply the User Object to a Firewall Rule
- Step 3. Verify the Order of the Firewall Rules

Step 1. Create a User Object

Before you begin:

Because users are included by their login names or authentication groups, verify that you have set up authentication. For more information, see:

- How to Integrate with an External Authentication Service
- How to Configure Local Authentication

To create a user object:

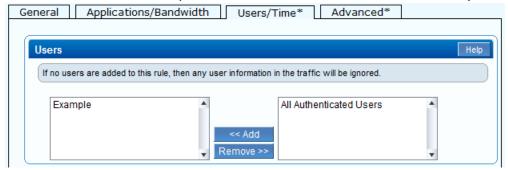

- 1. Go to the FIREWALL > User Objects page.
- 2. Click Create User Object.
- 3. Enter a name for the user object.
- 4. (Optional) Enter a description for the user object.
- 5. To include an existing user object, click the **User** tab.
- 6. To include users by login name or group, click the Group tab.
- 7. At the bottom of the window, click Add.

Step 2. Apply the User Object to a Firewall Rule

To apply the user object to a firewall rule:

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Create or edit a firewall rule.
- 3. In the rule editor window, click the $\mbox{\bf Users/Time}$ tab.

4. In the **Users** section, add the user objects that include the users whose traffic should be handled by the rule.

5. At the top of the rule editor window, click Add or Save.

Step 3. Verify the Order of the Firewall Rules

Because rules are processed from top to bottom, ensure that you arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

How to Configure Bandwidth Policies (QoS)

Limited network resources make bandwidth prioritization necessary. To ensure that important business critical applications are given enough bandwidth, the Barracuda Firewall provides traffic shaping (also known as "packet shaping" and "Quality of Service") methods to let you prioritize network resources according to factors such as the time of day, application type, and user identity. You can identify the traffic and assign its priority using firewall rules.

In this article:

- Bandwidth Policies
- · Queues and Rate Limits
- · Customize the Class Weights and Rate Limits
- Assign a Bandwidth Policy to a Firewall Rule
- Monitor Bandwidth Policy Assignment

Bandwidth Policies

There are eight different bandwidth policies. They are listed in the following table, in order of decreasing priority:

Bandwidth Policy	Description
VoIP	Highest priority before all other bandwidth policies. Traffic is sent with no delay.
Interactive	Highest priority.
Business	Very high priority.
Internet	Medium priority. If more than 10 MB of data is transferred in one session, then the priority of the traffic in that session drops to the same as Background.
Background	Next lower priority.
Low	Low priority. Low and Lowest Priority are limited to 5% of the available bandwidth.
Lowest Priority	Lowest priority. Low and Lowest Priority are limited to 5% of the available bandwidth.
Choke	Applications assigned this are unusable but will not seek another way to send traffic. For example, if you wish to block Skype traffic, assign this policy to the Skype application.

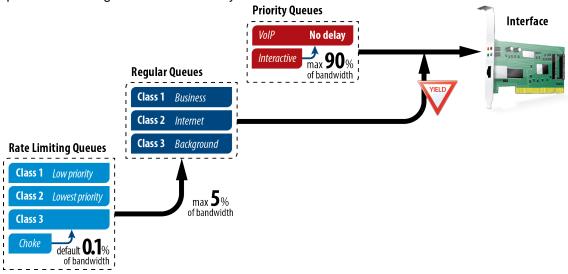

Queues and Rate Limits

The following diagram shows how the eight bandwidth policies are divided into queues:

- The Priority Queues always take precedence.
- The Regular Queues can use unlimited bandwidth.
- The Rate Limiting Queues are collectively limited to 5% of the maximum link bandwidth.

The rate limits always apply, so even if there is no other traffic, the traffic in the Rate Limiting Queues never uses more than 5% of the bandwidth.

The classes within the Regular and Rate Limiting queues are weighted relative to the other classes in the same queue. Class weights are enforced only when the link is saturated.

Customize the Class Weights and Rate Limits

On the FIREWALL > QoS page, you can set the weight ratios for the classes within the same queue and modify some of the rate limits.

Assign a Bandwidth Policy to a Firewall Rule

Before you begin, verify that you specify a bandwidth for each interface on which you want to enable QoS:

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the Network Interface Configuration section, select the interface and click the No/Yes link in the Use QoS column.
- 3. Enter the bandwidth assigned by your ISP for outbound and inbound connections.

To assign a bandwidth policy to a firewall rule:

- 1. Go to FIREWALL > Firewall Rules and edit the rule.
- 2. Click the Applications/Bandwidth tab.
- 3. From the Bandwidth Policy list, select the bandwidth policy.

Monitor Bandwidth Policy Assignment

To monitor which bandwidth policy is assigned to active network sessions, go to the **BASIC > Active Connections** page. The assigned policy of a network session is displayed in the **Bandwidth Policy** column. You can also manually override the assigned bandwidth policy by using the drop-down menu in the **Bandwidth Policy** column.

How to Configure the Captive Portal

With the captive portal, you can control access to the Internet or other networks. Unauthenticated users from specific network segments or network interfaces must log in before they are granted access. Users who have already been authenticated or have been identified by the Barracuda DC Agent are not prompted to log in.

In this article:

- · Configure the Captive Portal
- Upload a Certificate
- · Monitoring and Managing Authentication Users

Configure the Captive Portal

Before you begin:

- Verify that the confirmation message and ticketing features are disabled. Go to the NETWORK > IP Configuration page, and edit the
 relevant Wi-Fi interface to specify that there is no Landing Page.
- Before configuring the captive portal for use with Wi-Fi, see How to Configure Wi-Fi to verify that you have correctly configured Wi-Fi.
 Also ensure that users are connected to the Wi-Fi network of the Barracuda Firewall.

To configure the captive portal:

- 1. Go to the FIREWALL > Captive Portal page.
- 2. In the **Basic Configuration** section, enable the captive portal, specify the networks from which unauthenticated users are redirected to the captive portal, select the method of authenticating users, and edit the user access policies.
- 3. If you are using local authentication, go to the USERS > Local Authentication page to create your list of allowed users and groups.
- 4. On the **FIREWALL > Firewall Rules** page, set up a firewall rule (plus one for Wi-Fi, if applicable) to allow traffic for authenticated users. For example, you can create a firewall rule with the following settings to allow successfully authenticated users from a Wi-Fi network at 192.168.201.0/24 to access the Internet. When using the default firewall rules of a Barracuda Firewall, no additional rule is necessary because the LAN-2-Internet rule allows Internet access from the trusted LAN.
 - General tab
 - Action: Allow
 - Connection: Dynamic SNAT
 - Service: HTTP+S
 - Source: 192.168.201.0/24
 - Destination: Internet (Network Object)
 - Users/Time tab
 - Add All Authenticated Users.
- Add a firewall rule that blocks unauthenticated users on the captive portal network. Place this rule below your custom rule or below the L AN-2-Internet rule.
 - · General tab
 - Action: BlockService: Any
 - Source: 192.168.201.0/24Destination: Any (Network Object)
 - Users/Time tab
 - Authenticated Users needs to be empty.
- ①

Barracuda Networks recommends that you select **Unclassified** for the **Classification** of the network interface that serves the captive portal.

Upload a Certificate

To avoid browser warnings because of a self-signed certificate offered by the authentication page of the captive portal, you can upload your own trusted server certificate to the Barracuda Firewall. Install either the trusted server certificate (self-signed) or the issuer certificate (CA-signed) on redirected clients to let browsers verify the identity of the captive portal page.

To upload a certificate to the Barracuda Firewall:

- 1. Go to the VPN > Certificates page.
- 2. In the Upload Certificate section, click Browse, select the certificate (either in PKCS12 or PEM format), and click Upload Now.
 - Ensure that the Common Name field of the certificate contains a DNS-resolvable hostname or an IP address that is reachable via the Barracuda Firewall.
- 3. Go to the FIREWALL > Captive Portal page, select the newly-installed certificate from the Signed Certificate list, and click Save Changes.

Monitoring and Managing Authentication Users

On the BASIC > User Activity page, you can view currently authenticated users. You can also disconnect specific users.

Example - Allowing HTTP Traffic

When you configure firewall rules to allow network traffic, you can choose to allow traffic only for certain types of traffic that are passing to and from specific networks. You might want to create rules that allow wanted traffic to pass, and then use the BLOCKALL rule to block all other types of traffic.

This article provides an example of how to configure a firewall rule that only allows HTTP and HTTPS connections from the local 192.168.200.0/24 network to the Internet.

In this article:

- Step 1. Create the Firewall Rule to Allow Traffic
- Step 2. Verify the Order of the Firewall Rules

Step 1. Create the Firewall Rule to Allow Traffic

To create the firewall rule:

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Click Add Access Rule to create a new firewall rule.
- 3. In the Add Access Rule window, enter a name and description for the rule.
- 4. Specify the following settings:

Action	Connection	Service	Source	Destination
Allow	Default (SNAT)	HTTP+S	192.168.200.0/24	Internet

To allow HTTP and HTTPS connections from the local 192.168.200.0/24 network (class C) to the Internet, the Barracuda Firewall must perform source-based NAT. The source IP address of outgoing packets is changed from that of the client residing in the LAN to the WAN IP address of the Barracuda Firewall, so the connection is established between the WAN IP address and destination IP address. The destination address of reply packets belonging to this session is rewritten with the client's IP address.

5. At the top of the Add Access Rule window, click Add.

Step 2. Verify the Order of the Firewall Rules

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

Example - Handling SMTP (Mail) Traffic

You must configure at least one firewall rule to control mail traffic. Direct SMTP traffic to your Barracuda Spam & Virus Firewall or your mail server. If your mail server supports POP/IMAP access, configure a rule that allows this access. If you have more than one external IP address, configure a firewall rule to ensure that outgoing traffic uses the correct IP address.

In this article:

- Incoming Traffic
 - Case 1 Barracuda Spam & Virus Firewall
 - Case 2 Barracuda Spam & Virus Firewall and a POP/IMAP Mail Server
 - Case 3 Mail Server Only
 - Verify Firewall Rule Order
- Outgoing Traffic
 - Case 1 Mail Server Not on Trusted LAN
 - Case 2 Multiple Public IP Addresses
 - Verify Firewall Rule Order

Incoming Traffic

If your mail server or Barracuda Spam & Virus Firewall is on the public network, you might want to allow your Barracuda Firewall to provide protection and move your mail system onto the internal network. The mail traffic passes through the Barracuda Firewall in both directions.

If the advertised method of receiving email is a dynamically-assigned IP address, use a service such as DynDNS to make a permanent identifier for your mail server or Barracuda Spam & Virus Firewall. For more information on the DynDNS service, see http://dyn.com/dns/ 🛂.

As you can see on the **FIREWALL > Service Objects** page, the Any-EMAIL service object contains the following email protocols: POP2, POP3S, POP3, IMAP, IMAPS and SMTP. You can use this object or just the protocols that you want to support. The rules below specify the protocols explicitly. Configure the firewall rules for the cases that match your scenario, and then verify your firewall rule order.

Case 1 - Barracuda Spam & Virus Firewall

Configure a rule to redirect incoming mail traffic for the Barracuda Spam & Virus Firewall. If you have a Barracuda Spam & Virus Firewall and your mail server does not support POP or IMAP, this is the only rule that you will need for incoming email traffic.

Go to the FIREWALL > Firewall Rules page and configure the following rule to redirect the incoming mail traffic:

SMTP-2-SPAMFW Values:

Action	Source	Destination	Service	Connection	Redirected To
DNAT	Either the Internet n etwork object or a specific public IP address. For example, the IP address of the hosting provider.	The destination depends on the advertised method of receiving email. If it is: • One or more external static IP addresses, enter those addresses (a CIDR summarization of addresses can also be used). • A domain name which maps to a dynamically-ass igned IP address, select the network object named A ny.	SMTP	No SNAT (the original source IP address is used)	The internal static IP address of the Barracuda Spam & Virus Firewall.

Case 2 - Barracuda Spam & Virus Firewall and a POP/IMAP Mail Server

If you have a Barracuda Spam & Virus Firewall and you also want to support POP/IMAP traffic from your mail server, then you must add this rule in addition to the above rule for the Barracuda Spam & Virus Firewall.

Go to the FIREWALL > Firewall Rules page and configure the following rule to redirect the incoming POP/IMAP traffic only to the mail server:

POP-2-INTERNAL Values:

Action Source Destination Service (select relevant ones)	Connection	Redirected To
--	------------	---------------

DNAT	Either the Internet n etwork object or a specific public IP address. For example, the IP address of the hosting provider.	The destination depends on the advertised method of receiving email. If it is: • One or more external static IP addresses, enter those addresses (a CIDR summarization of addresses can also be used). • A domain name which maps to a dynamically assigned IP address, select the network object named A ny.	POP2 POP3 POP3S IMAP IMAPS	No SNAT (the original source IP address is used)	The internal static IP address of the mail server.
------	---	--	----------------------------	--	--

Case 3 - Mail Server Only

If you do not have a Barracuda Spam & Virus Firewall, you can redirect the incoming traffic to the mail server that is on your internal network. Go to the **FIREWALL > Firewall Rules** page and configure the following rule to redirect the incoming mail traffic:

EMAIL-2-MAIL-SERVER Values:

Action	Source	Destination	Service (select relevant ones)	Connection	Redirected To
DNAT	Either the Internet n etwork object or a specific public IP address. For example, the IP address of the hosting provider.	The destination depends on the advertised method of receiving email. If it is: • One or more external static IP addresses, e nter those addresses (a CIDR summarization of addresses can also be used). • A domain name which maps to a dynamically assigned IP address, select the network object named A ny.	SMTP POP2 POP3 POP3S IMAP IMAPS	No SNAT (the original source IP address is used)	The internal static IP address of the mail server.

Verify the order of the firewall rule(s) that you created. New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked. After adjusting the order of rules in the rule set, click **Save Changes**.

Outgoing Traffic

Outgoing SMTP traffic (for outgoing email) must also be allowed to pass. Depending on the location of your mail server, this traffic might already be allowed by the pre-installed LAN-2-INTERNET rule. If it is not, or if you want to make an explicit rule anyway, you must add a rule.

Configure the firewall rules for the case that matches your scenario. If you have multiple public IP addresses, follow the instructions in Case 2 – Multiple Public IP Addresses to ensure that the traffic leaves on the same IP address that the public MX record points to. If you do not have multiple IP addresses, follow the instructions in Case 1 – Mail Server Not on Trusted LAN. After configuring the required firewall rule, verify your firewall rule order.

Case 1 - Mail Server Not on Trusted LAN

Go to the FIREWALL > Firewall Rules page and configure the following rule to allow outgoing SMTP traffic:

SMTP-2-INTERNET Values:

Action	Source	Destination	Service (select relevant ones)	Connection
Allow	The internal IP address of the mail server	Internet	SMTP	Default (SNAT)

Case 2 - Multiple Public IP Addresses

If you have multiple external IP addresses and want to force outbound SMTP traffic to use a specific IP address:

- Go to the FIREWALL > Connection Objects page and create a connection object that specifies the IP address that is in the MX record.
- 2. Go to the FIREWALL > Firewall Rules page and add the following rule to direct the outgoing mail traffic:

SMTP-2-INTERNET Values:

Action	Source	Destination	Service	Connection
Allow	The internal IP address of the mail server	Internet	SMTP	A connection object with the IP address used for email.

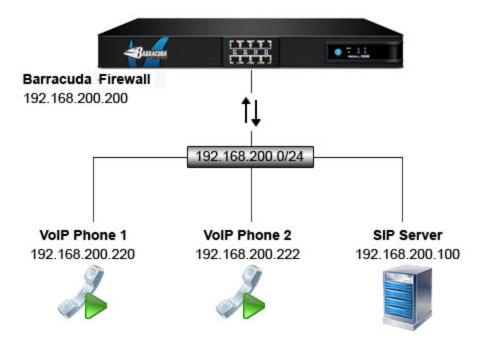

Verify Firewall Rule Order

Move the firewall rule above the pre-installed LAN-2-INTERNET rule. If this rule is below the LAN-2-INTERNET rule, traffic goes out on the primary IP address, which might not be the correct path. After adjusting the order of rules in the rule set, click **Save Changes**.

Example - Allowing VoIP/SIP Traffic

For SIP-based VoIP traffic, create a forwarding firewall rule that redirects traffic to the internal SIP proxy of the Barracuda Firewall. The SIP proxy dynamically opens all necessary RTP ports for successful SIP communication through the Barracuda Firewall. You must also create a separate firewall rule to allow traffic from the Internet to the SIP proxy.

This article provides an example of how to configure firewall rules for VoIP phones that use the same network subnet as the internal SIP server. The VoIP phones and SIP server are located in the the 192.168.200.0/24 network.

In this article:

- Step 1. Configure a Firewall Rule for the Connection from the SIP Server to Internet
- Step 2. Configure a Firewall Rule for the Connection from the Internet to the SIP Server
- Step 3. Verify the Order of the Rules in the Rule Set

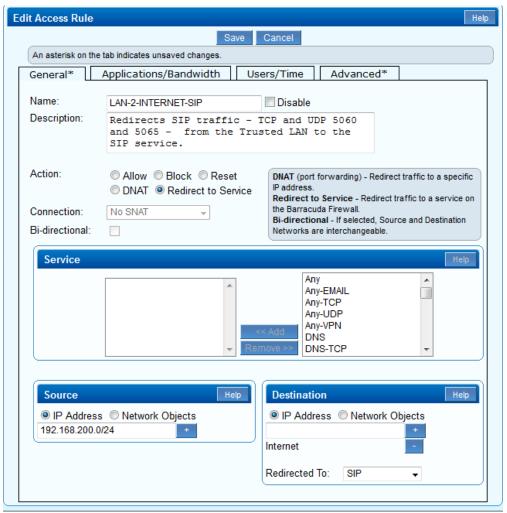

Step 1. Configure a Firewall Rule for the Connection from the SIP Server to Internet

To let SIP-based VoIP communication pass the firewall, configure a forwarding firewall rule that redirects traffic to the SIP proxy. You can create a new firewall rule or edit an existing rule. This example edits the LAN-2-INTERNET-SIP rule.

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Edit the LAN-2-INTERNET-SIP rule. Ensure that it is enabled. Specify the following settings:

Action	Source	Destination	Redirected To
Redirect to Service	192.168.200.0/24	Internet	SIP

In this example, the **Source** includes the SIP server and the phones. The **Destination** specifies the destination of the SIP network traffic that is allowed. Usually, the destination is the public IP address of your SIP provider. Here, **Destination** is the predefined **Internet** network object, but you can also enter the network address of your SIP provider.

3. At the top of the Edit Access Rule window, click Save.

Step 2. Configure a Firewall Rule for the Connection from the Internet to the SIP Server

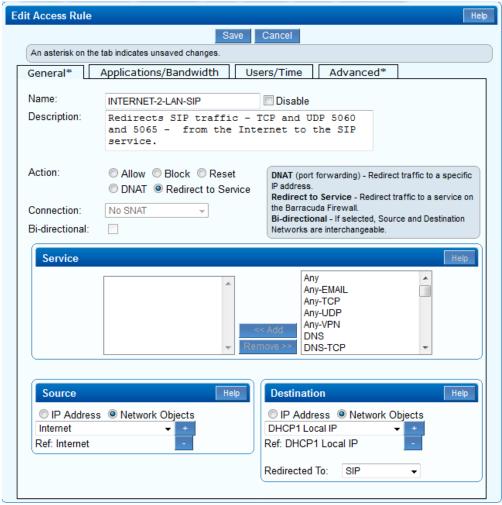

Configure a separate forwarding firewall rule to allow connections from the Internet to the SIP server. You can create a new firewall rule or edit an existing rule. This example edits the INTERNET-2-LAN-SIP rule.

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Edit the INTERNET-2-LAN-SIP rule. Ensure that it is enabled. Specify the following settings:

Action	Source	Destination	Redirected To
Redirect to Service	Internet	DHCP1 Local IP	SIP

The **Source** section specifies the origin of the network traffic that should be allowed. This example uses the predefined **Internet** network object, but you can also enter the IP address of your SIP provider.

The **Destination** section specifies the public IP address that is allowed to receive SIP traffic. This example uses the predefined **DHCP1 Local IP** network object, but you can also enter the public IP address.

3. At the top of the Edit Access Rule window, click Add.

Step 3. Verify the Order of the Rules in the Rule Set

Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

Example - Blocking FTP Traffic

If you use the default rules, all traffic is allowed from the LAN to the Internet. If you keep the rules that include **Service** set to **Any**, you might want to add rules that block traffic with specific profiles. For example, you can block certain types of traffic or traffic from certain users.

This article provides an example of how to configure a firewall rule that blocks all FTP traffic from the local LAN to the Internet.

In this article:

- Step 1. Create the Firewall Rule to Block FTP Traffic
- Step 2. Verify the Order of the Firewall Rules

Step 1. Create the Firewall Rule to Block FTP Traffic

To create the firewall rule:

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Click Add Access Rule to create a new firewall rule.
- 3. In the Add Access Rule window, enter a name and description for the rule.
- 4. Specify the following settings:

Action	Service	Source	Destination
Block	FTP	Trusted LAN Networks	Internet

5. At the top of the Add Access Rule window, click Add.

Step 2. Verify the Order of the Firewall Rules

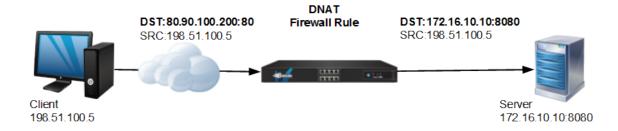

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. In this case, place this rule above the LAN-2-INTERNET rule that allows all traffic from the LAN to the Internet.

After adjusting the order of rules in the rule set, click Save Changes.

Example - Configuring a DNAT Firewall Rule

To reach services running on servers in the DMZ behind the firewall, configure a **Destination NAT (DNAT)** rule to forward the traffic arriving on the WAN port to the correct server and port in the DMZ.

This article provides instructions on how to configure a firewall rule for the setup that is displayed in the following figure:

In this article:

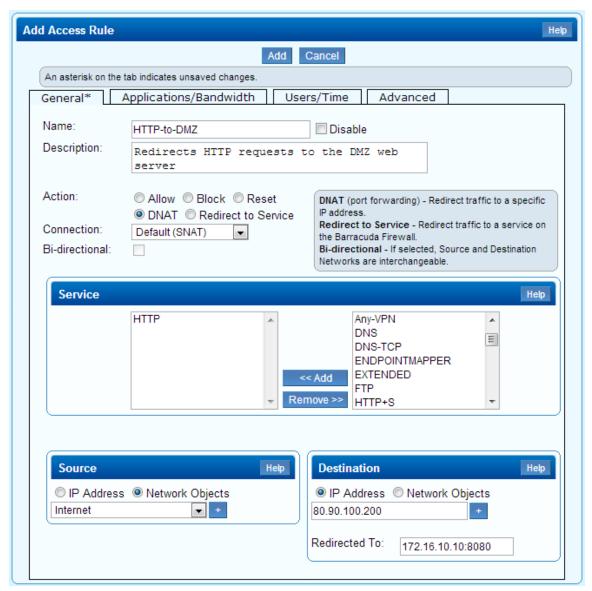

- Step 1. Configure a DNAT Firewall Rule
- Step 2. Verify the Order of the Firewall Rules

Step 1. Configure a DNAT Firewall Rule

This example creates a DNAT firewall rule that allows HTTP traffic from the Internet to the web server residing in the DMZ.

- 1. Go to the **FIREWALL > Firewall Rules** page.
- 2. Click Add Access Rule to create a new firewall rule.
- 3. In the Add Access Rule window, enter a name and description for the rule.
- 4. Specify the following settings:

Action	Connection	Service	Source	Destination	Redirected To
DNAT	Default (SNAT)	НТТР	Internet	80.90.100.200	172.16.10.10:8 080

5. At the top of the Add Access Rule window, click Add.

Step 2. Verify the Order of the Firewall Rules

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

Example - Creating Time-Based Firewall Rules

With the Barracuda Firewall, you can configure firewall rules that are only active for specific times or dates. Create a time object for the times that the firewall rule should be active. Then apply this time object to the firewall rule.

This article provides an example of how to configure a firewall rule that blocks Internet (HTTP and HTTPS) access for two trainees from Monday to Friday, except during the hours of 11:00 AM to 01:00 PM. The two trainees reside in the 192.168.200.0/24 network segment and use computers with the 192.168.200.100 and 192.168.200.101 IP addresses.

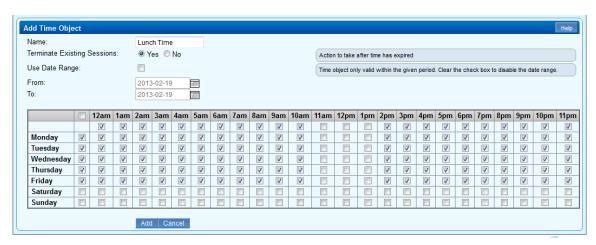

In this article:

- Step 1. Create a Time Object
- Step 2. Create the Firewall Rule with the Time Object
- Step 3. Verify the Order of the Firewall Rules

Step 1. Create a Time Object

This example configures a time object named Lunch Time that includes all office hours except 11am to 1pm.

- 1. Go to the FIREWALL > Time Objects page.
- 2. In the Time Objects section, click Add Time Object.
- 3. In the Name field, enter Lunch Time.
- 4. To terminate existing sessions when the firewall rule is applied, set Terminate Existing Sessions to Yes.
- 5. To define a date range for this time object, select the **Use Date Range** check box.
- 6. In the time table of the configuration window, select all days and times when the firewall rule should be active.

7. Click Add to create the time object.

Step 2. Create the Firewall Rule with the Time Object

This example configures a firewall rule named Block-HTTPs-for-trainees that blocks HTTP and HTTPS network traffic from the 192.168.200.100 and 192.168.200.101 IP addresses.

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Click Add Access Rule to create a new firewall rule. The Add Access Rule window opens.
- 3. Enter a name and description for the rule.
- 4. Specify the following settings:

Name	Action	Connection	Service	Source	Destination
Block-HTTPS-fo r-Trainees	Block	Default (SNAT)	HTTP+S	• 192.168.200 .100 • 192.168.200 .101	Internet

Because all other clients in the 192.168.200.0/24 network should not be affected by this rule, the source network is limited to the 192.168.200.100 and 192.168.200.101 IP addresses.

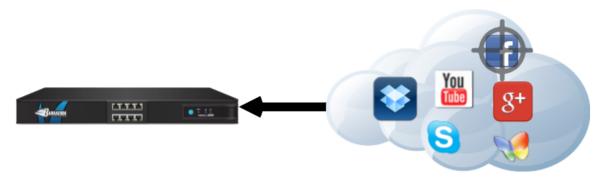

- 5. Click the Users/Time tab.
- 6. From the Time Object list, select the time object that you created. For this example, select the Lunch Time object.
- 7. At the top of the window, click Add.

Step 3. Verify the Order of the Firewall Rules

Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. For this example, place your time-based Block rule before any rule that allows Internet access. After adjusting the order of rules in the rule set, click **Save Changes**.

Example - Limiting Traffic for Applications

When using Application Control, you can choose to limit traffic for certain applications. This article provides an example of how to configure the default Application Control policy and a firewall rule to slow all connections to Facebook.

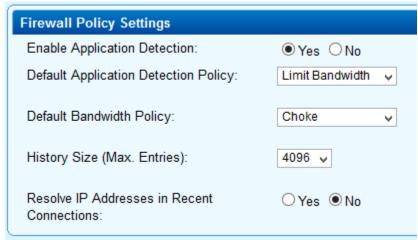

In this article:

- Step 1. Enable Application Control
- Step 2. Create a Firewall Rule to Choke Facebook Traffic
- Step 3. Verify the Order of the Firewall Rules
- Monitoring Traffic for Detected Applications

Step 1. Enable Application Control

Enable Application Control and select the Choke policy.

- 1. Go to the FIREWALL > Settings page.
- 2. Next to Enable Application Detection, click Yes.
- 3. Select the following settings:
 - Default Application Detection Policy: Limit Bandwidth
 - Default Bandwidth Policy: Choke

4. Click Save Changes.

Step 2. Create a Firewall Rule to Choke Facebook Traffic

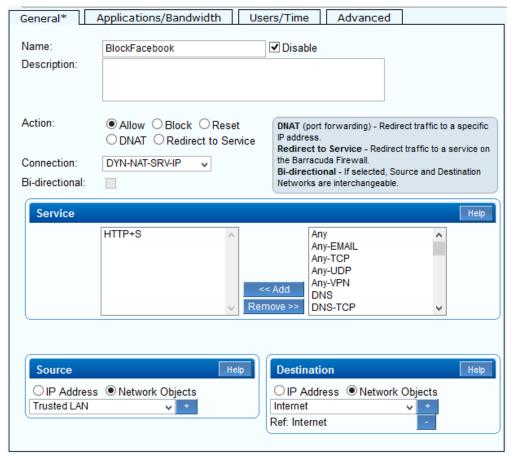

Because Application Control can impact the performance of the Barracuda Firewall, be as specific as possible with firewall rule settings.

The following steps create an example firewall rule named BlockFacebook that chokes traffic for Facebook:

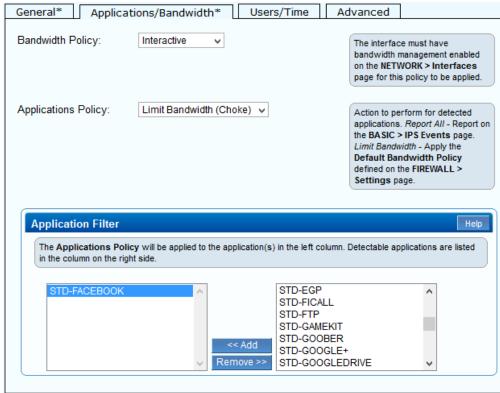

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Click Add Access Rule.
- 3. In the Add Access Rule window, click the General tab and then specify the following settings:
 - Name: BlockFacebook
 - Action: Allow
 - Service: HTTP+S

Change the **Service** setting if you want to block or throttle applications that are not HTTP or HTTPS based.

- Source: Trusted LAN Networks
- Destination: Internet

- 4. Click the Applications/Bandwidth tab and then specify the following settings:
 - Applications Policy: Limit Bandwidth (Choke)
 - Application Filter: STD-FACEBOOK

5. At the top of the Add Access Rule window, click Add.

Step 3. Verify the Order of the Firewall Rules

Because rules are processed from top to bottom, arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of the rules, click Save Changes.

For more information, see Firewall Rules Order.

Monitoring Traffic for Detected Applications

To view blocked or throttled connections, go to the **BASIC > IPS Events** page. In the **Service** column for each connection, the detected application is listed. To view specific connections, you can filter the list of recent connections.

Example - Creating Connection Objects for Failover and Link Balancing

To balance traffic among multiple links, create a firewall rule that uses a connection object that you configure. This connection object references all of the links and configures how to balance the traffic among them. You can also specify one link that is used for all the traffic matching the firewall rule, as long as it is available. If that link fails, then the next link is used in its place.

To create the connection object:

- 1. Go to the FIREWALL > Connection Objects page.
- 2. Click Add Connection Object.
- 3. From the **NAT Type** list in the **Add Connection Object** window, select either **Explicit** (to use the IP address that you specify) or **From Interface** (to use the IP address of the link).
- 4. In the Failover and Load Balancing section, configure the following settings:
 - Multilink Policy Defines what happens if multiple links are configured. Available policies are:
 - None No fallback or source address cycling. This is not what you want for this object.
 - Failover Falls back to the first alternate addresses and interface, called Alternate 1. If Alternate 1 fails, fail over to
 Alternate 2 and so on. When the original link (the one configured in the top section) becomes available, the Barracuda
 Firewall automatically resumes directing traffic to that interface.
 - Weighted Round Robin Uses the IP addresses and interfaces configured as Alternate 1, 2, and 3, along with this
 interface, in weighted-round robin fashion.
 - Random Randomly uses one of the available IP addresses and interfaces specified in this object.
 - · Specify the following for each of the alternate links:
 - NAT Type Select one of these options:
 - From Interface Source NAT using the first IP address on the interface selected from the Interface list.
 - Explicit Uses the IP address in the IP address field.
 - Weight Only used for the weighted round robin policy. The weight numbers represent the traffic balancing ratio of the available links. The higher the relative number, the more the link is used. For example, if four links are configured in this object, weight values of 6, 2, 1, and 1 mean that traffic is balanced over the configured interfaces in a ratio of 6:2:1:1. As a result, 60% percent of the traffic passes over Link #1, 20% of the traffic passes over Alternate 1, 10% of the traffic is directed to Alternate 2, and 10% to Alternate 3.
- 5. Click Add.

After you have successfully created this connection object, you can go to the **FIREWALL > Firewall Rules** page and apply it to a rule that directs outgoing traffic.

Example - Routing Traffic Over Two Different ISP Connections

The Barracuda Firewall can classify and identify traffic to be routed via specific links. There are predefined connection objects for a number of ISP uplink types. In addition, you can create your own connection objects. The connection object defines the egress interface and source (NAT) IP address for traffic matching the firewall rule.

To route traffic over different ISP connections, you must configure a firewall rule for each connection type.

This article provides an example of how to configure firewall rules to route HTTP traffic through a primary ISP connection and FTP traffic through a secondary ISP connection. The following settings are used for the example scenario:

ISP	Туре	Service	Metric
Primary ISP (80 Mbit)	Static IP assignment	НТТР	100
Secondary ISP (4 0 Mbit)	Dynamic assignment	FTP	200

In this article:

- Step 1. Create a Firewall Rule for HTTP Traffic
- Step 2. Create a Firewall Rule for FTP Traffic
- Step 3. Verify the Order of the Firewall Rules
- Step 4. Verify the Routing Configuration

Related Articles

- Connection Objects
- Example Creating Connection Objects for Failover and Link Balancing

Step 1. Create a Firewall Rule for HTTP Traffic

This example creates a firewall rule named LAN-2-INTERNET-HTTP that passes HTTP traffic from the 10.0.10.0/24 network to the Internet.

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Click Add Access Rule to create a new firewall rule.
- 3. Specify the following settings:

Name	Action	Connection	Service	Source	Destination
LAN-2-INTERNET -HTTP	Allow	Default (SNAT)	нттр	10.0.10.0/24	Internet

The **Default (SNAT)** connection object makes the Barracuda Firewall perform source NAT with the IP address of the interface with the lowest metric (as determined by a routing table lookup). If the primary link is unavailable, HTTP traffic is directed to the secondary link.

4. At the top of the Add Access Rule window, click Add.

Step 2. Create a Firewall Rule for FTP Traffic

This example creates a firewall rule named LAN-2-INTERNET-FTP that passes FTP traffic from the 10.0.10.0/24 network to the Internet.

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Click Add Access Rule to create a new firewall rule.
- 3. Specify the following settings:

Name	Action	Connection	Service	Source	Destination
LAN-2-INTERNET -FTP	Allow	SNAT with DHCP	FTP	10.0.10.0/24	Internet

The **SNAT** with **DHCP IP** connection object makes the Barracuda Firewall perform source NAT with the first IP address of the DHCP interface. If this link becomes unavailable, the traffic is dropped. No failover to another link will occur. If you want failover to occur, you can create a new connection object that includes both links and specifies which one is used as the failover link. For more information, see Example - Creating Connection Objects for Failover and Link Balancing.

4. At the top of the Add Access Rule window, click Add.

Step 3. Verify the Order of the Firewall Rules

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom, arrange your rules in the correct

order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

Step 4. Verify the Routing Configuration

To verify that traffic is routed correctly according to your firewall rules:

1. Go to the **BASIC** > **Active Routes** page and check the routing table.

By default, routing always prioritizes the interface with the lowest metric configured in the firewall routing settings.

2. Go to the **BASIC > Recent Connections** page and filter the entries for your service types.

Example - Configuring Dual ISPs with Automatic Failover

On the Barracuda Firewall, you can configure redundant ISPs with automatic failover. The primary uplink can be a 3G, DHCP, or WAN connection with static or dynamic IP address assignment.

This article provides an example of how to configure two redundant ISPs.

In this article:

- Configure Dual ISP Routing
- Verify Your Configuration
- · Configuring a Firewall Rule for Failover

Related Articles

- Connection Objects
- How to Create Connection Objects for Failover and Link Balancing

Configure Dual ISP Routing

Before you begin:

Configure two ISPs as described in How to Configure WAN Interfaces.

To configure dual ISP routing:

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the configurations for the primary and secondary interfaces, edit the Metric setting to specify the route priority. In a multiprovider configuration, the Barracuda Firewall selects the interface with the lowest metric value for outgoing traffic, assuming that it is available. Specify a higher metric value for the secondary or backup ISP uplink.

For example, use the following values for your primary and secondary interfaces:

• Primary ISP Metric: 100

Secondary ISP Metric: 200

- 3. Click Save Changes.
- 4. At the top of the page, click on the warning message to execute the new network configuration.

Verify Your Configuration

To verify your routing configurations, go to the the following pages:

- BASIC > Active Routes
- **BASIC > Active Connections**

Configuring a Firewall Rule for Failover

To automatically failover from the primary to the secondary ISP, use the Default (SNAT) connection object in the firewall rule. The Default (SNAT)

connection object makes the Barracuda Firewall perform a source NAT using the local IP address obtained from a routing lookup to the destination.

Managing Users and Groups

For user and group authentication, you can either administer users locally on the Barracuda Firewall or integrate the Barracuda Firewall with an external authentication server. You can use the information from these authentication services when you configure VPNs, user-aware firewall rules, and the captive portal.

To manage guest access to the network, you can use a confirmation page or a guest ticketing system.

Local Authentication

If no external authentication servers are available, you can administer users with the local authentication service.

For instructions on how to set up local authentication, see How to Configure Local Authentication.

External Authentication Servers

The following external authentication servers are supported:

- · Microsoft Active Directory
- Barracuda DC Agent
- NTLM
- MS-CHAPv2
- LDAP
- RADIUS
- OCSP

For instructions on how to integrate the Barracuda Firewall with these servers, see How to Integrate with an External Authentication Service.

Guest Access

To grant guest access to the network, you can use the following:

- Confirmation Page Prompts guests to agree to Terms of Service before they can access the network. For more information, see How
 to Set Up a Guest Access Confirmation Page.
- Guest Ticketing Assigns guests with tickets that give them credentials to temporarily access the network. For more information, see H
 ow to Set Up Guest Access with Ticketing and How to Manage Guest Tickets User's Guide.

How to Configure Local Authentication

If you do not have an external authentication service available, you can create and maintain a list of local users and groups on the Barracuda Firewall. These users and groups can be used when creating firewall rules, VPNs, or captive portals.

To set up local authentication, go to the USERS > Local Authentication page. In the Local Users and Groups table, add users and groups.

Ensure that you enter the correct group names. If you misspell a group name (e.g., tst instead of test), a new group is created and permissions are not applied correctly to the group.

For more information on the local authentication settings, click Help on the page.

How to Integrate with an External Authentication Service

By integrating the Barracuda Firewall with your existing authentication server, you can configure firewall rules that apply to specific users and groups without having to create local user accounts on the Barracuda Firewall.

Go to the **USERS > External Authentication** page to integrate the Barracuda Firewall with your existing authentication system and select the type of authentication service to configure:

- Barracuda DC Agent
- Active Directory
- NTLM
- LDAP
- RADIUS
- OCSP
- · Group Filter Patterns

Barracuda DC Agent

The Barracuda DC Agent runs on either the domain controller or a dedicated Windows PC on the office network. To record authenticated users, it periodically checks the domain controller for login events. The IP addresses of authenticated users are mapped to their username and group context. The list of authenticated users is provided to the Barracuda Firewall, allowing true single sign-on capabilities. For more information about the Barracuda DC Agent, see The Barracuda DC Agent for User Authentication. You can download the Barracuda DC Agent from your Barracuda Cloud Control Account.

DC Agent Settings

If your domain controller runs Windows Server 2003 with Service Pack 2 (SP2) or Windows Server 2008, you can install the Barracuda DC Agent on it to monitor user authentications. Then you can configure the Barracuda Firewall to query the Barracuda DC Agent so that it can recognize your authenticated users and provide single sign-on.

Do not install the Barracuda DC Agent on your NTLM domain controller.

The Barracuda DC Agent enables the Barracuda Firewall to transparently track user login activity in your Windows domains. You must configure the following software components:

- Domain controller audit policies Configure local audit policies to generate an account logon event whenever a domain user account
 is authenticated on the domain controller.
- Barracuda DC Agent Install and configure the DC Agent on each domain controller. Specify which Barracuda Firewalls that the DC Agent must communicate with. Each instance of this service maintains a record of all the users that have been authenticated by the domain controller. You only need to create *one* authentication service per domain controller.
- Barracuda Firewall Enable single sign-on for your authenticated LDAP domain users, and specify the domain controllers where the Barracuda DC Agent is installed. The Barracuda Firewall periodically polls each domain controller to obtain information about authenticated LDAP users.

Install the Barracuda DC Agent

- As admin, install, configure, and test the Barracuda DC Agent on your domain controllers or dedicated Windows PC. Follow the
 instructions in How to Get and Configure the Barracuda DC Agent. Configuration instructions are also provided in the Barracuda DC
 Agent administrative interface.
- 2. When you configure the DC Agent, you can also configure the domain controller to audit user logon and logoff activity and to generate an account logon event whenever a user is authenticated.
- 3. Go to the USERS > External Authentication page and configure the Barracuda Firewall to communicate with the DC Agent.
 - a. Click the DC Agent tab.
 - b. Set Enable Single Sign-On to Yes.
 - c. Specify the following information about each DC Agent and then click Add:
 - **Domain Controller IP** The IP address of the domain controller running the DC Agent. The Barracuda Firewall polls the DC Agent to obtain the list of users authenticated against this domain controller.
 - DC Agent Listening Port The port used by the DC Agent to communicate with the Barracuda Firewall. The default
 port number is 5049.
 - Synchronization Interval The interval (in seconds) in which the Barracuda Firewall polls the DC Agent for the list of authenticated users. The recommended value is 15 seconds.
- 4. (Optional)Exempt specific LDAP domain users.
 - a. In the **Exempt User Name** field, enter the account username. You can use Perl-compatible regular expression (PCRE) pattern-matching notation to specify the account username (such as \w for any alphanumeric character or \W for any non-alphanumeric character).

Active Directory

Microsoft Active Directory (MSAD) is a directory service that allows authentication and authorization of users in a network. It has been included with all Windows Server operating systems since Windows 2000 Server. MSAD is used for single sign-on for many services. Permissions are managed by group. Users inherit the permissions of all the groups that they are members of. Backward-compatibility for older services is provided by NTLM/MS-CHAP options that you can activate and configure on the MSAD server. All information is kept in a single directory information tree.

To configure Active Directory:

- 1. Go to the USERS > External Authentication page.
- 2. Click the Active Directory tab.
- 3. In the Basic table, edit or add an Active Directory authentication configuration for one or more domain controllers.
- 4. In the Patterns table, you can create or delete group filter patterns. For more information, see Group Filter Patterns.

NTLM

If your network uses an NT LAN Manager (NTLM) authentication server, your NTLM domain users are transparently authenticated using their Microsoft Windows credentials. This single sign-on method of access control is provided by transparent proxy authentication against the your NTLM server. To enable transparent proxy authentication against your NTLM server, you must join the Barracuda Firewall to the NTLM domain as an authorized host.

To enable NTLM user authentication:

- 1. Go to the USERS > External Authentication page.
- 2. Click the NTLM tab.
- 3. Enter the settings for your NTLM server and then click Save.

LDAP

Lightweight Directory Access Protocol (LDAP) is used for storing and managing distributed information services in a network. LDAP is mainly used to provide a single sign-on solution. It follows the same X.500 directory structure as MSAD.

To configure LDAP:

- 1. Go to the USERS > External Authentication page.
- 2. Click the LDAP tab.
- 3. In the Basic table, edit or add LDAP authentication configurations for one or more domain controllers.
- 4. In the Patterns table, you can create or delete group filter patterns. For more information, see Group Filter Patterns.

RADIUS

Remote Access Dial In User Service (RADIUS) is a networking protocol providing authentication, authorization, and accounting. The Barracuda Firewall uses RADIUS authentication for the IPsec, client-to-site, and SSL VPN.

To enable integration with RADIUS:

- 1. Go to the USERS > External Authentication page.
- 2. Click the RADIUS tab.
- 3. Enter the settings for your RADIUS server and then click Save.

OCSP

Online Certificate Status Protocol (OCSP) is a protocol used to verify if X.509 certificates have been revoked by their respective CAs. The Barracuda Firewall can use the information provided by an OCSP server to verify the authenticity of a certificate.

For integration with OCSP-based online digital certification verification:

- 1. Go to the USERS > External Authentication page.
- 2. Click the OCSP tab.
- 3. Enter the settings for your OCSP server and then click Save.

Group Filter Patterns

For Active Directory and LDAP, you can use group filter patterns. These patterns are typically used in large environments to filter unwanted group membership information and are not affected by authentication against the Active Directory or LDAP. You can use wildcard characters in the patterns.

For example, if you use the following group filter pattern:

SSL

And the following group membership strings are used:

- User01 group membership string: CN=xyz, OU=sales, DC=mycompany, DC=com
- User02 group membership string: CN=SSL VPN, DC=mycompany, DC=com

Then only User02 will match.

How to Join a Windows Domain

To successfully join the Barracuda Firewall to a Windows domain, you must first configure DNS, Active Directory authentication, and NTLM authentication. Joining a domain is required for NTLM or MS-CHAP authentication requests to be accepted by the domain controller. This is important for client-to-site VPN access and user-based firewall rules.

In this article:

- Step 1. Configure DNS
- Step 2. Configure Active Directory Authentication
- Step 3. Configure NTLM Authentication
- · Step 4. Join the Domain

Step 1. Configure DNS

Because many of the requests for a domain join and subsequent authentication must query the domain controller directly, you must specify your domain controllers in the DNS configuration.

- 1. Go to the **NETWORK > IP Configuration** page.
- 2. In the DNS Configuration section, enter the IP addresses of your first and second domain controllers.
- 3. Click Save Changes.
- 4. Verify that the Barracuda Firewall has a host entry in your Active Directory. By default, the hostname is the product model name. For example, the hostname for a Barracuda Firewall X200 is x200.

Step 2. Configure Active Directory Authentication

To configure Active Directory authentication:

- 1. Go to the USERS > External Authentication page.
- 2. Click the Active Directory tab.
- 3. Add the information for your primary domain controller. It is critical that your settings are correct and match the domain.
 - If you want to use group selection with MS-CHAP authentication, enable Cache MSAD Groups.
 - For the domain join, you do not need to configure the settings in the **Extended** section.

For more details about the settings, click Help on the page.

4. Click Save Changes.

Step 3. Configure NTLM Authentication

To configure NTLM authentication:

- 1. Go to the USERS > External Authentication page.
- 2. Click the NTLM tab.
- 3. Configure and save the NTLM settings.

It is not necessary to have WINS running on your domain, but you must configure the WINS Servers setting.

4. Click Save Changes.

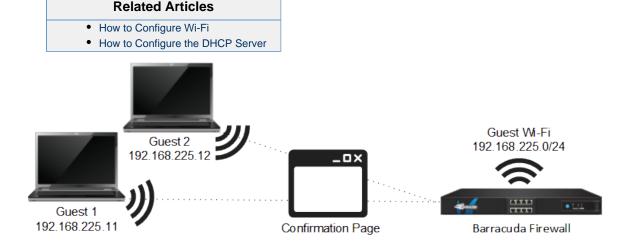

Step 4. Join the Domain

To join the domain:

- 1. Go to the **BASIC > Administration** page.
- In the Domain Configuration section, verify that your hostname and domain are entered in the Default Host Name and Default Domain fields. If not, enter and save the correct settings.
- 3. In the **Windows Domain Username** and **Windows Domain Password** fields, enter the credentials for a user account with permissions to join the domain (such as an administrator). These user credentials are not saved and are only used once during the join attempt.
- 4. Click Join Domain.
- 5. To verify that the join was successful, click Registration Status.

How to Set Up a Guest Access Confirmation Page

When setting up a guest network, you can configure the Barracuda Firewall to use a confirmation page that prompts guests to agree to Terms of Service before they can access the network. A confirmation page is typically used to grant network access to anonymous users.

In this article:

- Before You Begin
- Step 1. Set up the Guest Network Interface
 - On a Wi-Fi Interface
 - On a Wired Interface
- Step 2. Enable the DHCP Server for the Guest Network
- Step 3. (Wired Networks Only) Set up Guest Network
- Step 4. (Optional) Configure the Login Page

Before You Begin

- Ensure that the Barracuda Firewall has one unused network interface (Wi-Fi, Ethernet, or virtual, e.g., ath3, p3, or p3.100).
- Identify the guest network that you want to use (e.g., 192.168.225.0/24).

Step 1. Set up the Guest Network Interface

You can use Wi-Fi or a wired network for guest access.

On a Wi-Fi Interface

If Wi-Fi is available for your Barracuda Firewall model, you can configure a Wi-Fi network for guest access.

- In the Static Interface Configuration section, ensure that you specify the following settings:
 - **Network** -- The guest network (e.g., 192.168.225.0/24).
 - Services to Allow Select DNS Server.
 - Classification Click Trusted.
- In the Wi-Fi Link Configuration section, select Confirmation Message from the Landing Page list.

On a Wired Interface

Configure a static network interface. In the Static Interface Configuration, ensure that you specify the following settings:

- Network -- The guest network (e.g., 192.168.225.0/24).
- Services to Allow Select DNS Server.
- Classification Click Trusted.

Step 2. Enable the DHCP Server for the Guest Network

To automatically assign IP addresses for guests, enable a DHCP server for the guest network.

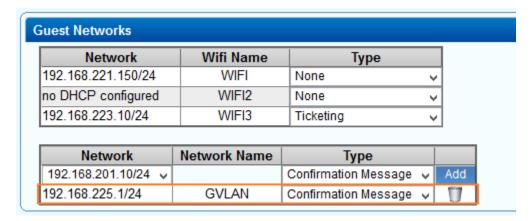

- 1. Go to the **NETWORK > DHCP Server** page.
- 2. In the DHCP Server section, enable the DHCP server.
- 3. In the Add DHCP Server Subnet section, configure the DHCP subnet. Ensure that you specify the following settings:
 - Beginning IP Address and Ending IP Address The range of IP addresses to be assigned to clients. For example, if your guest network is 192.168.225.0/24, the Beginning IP Address is 192.168.225.10 and the Ending IP Address is 192.168.2 25.250.
 - DNS Server The IP address of the DNS server.
- 4. Click Save Subnet. The guest network subnet appears in the DHCP Server Subnets section.

For more information on setting up a DHCP server, see How to Configure the DHCP Server.

Step 3. (Wired Networks Only) Set up Guest Network

If you configured the guest network on a wired interface, specify that the network uses the confirmation page for guest access.

- 1. Go to the USERS > Guest Access page.
- 2. In the Guest Networks section, select your guest network (e.g., 192.168.225.1/24) from the Network column.
- 3. From the **Type** column, select **Confirmation Message**.
- 4. Click Add.
- 5. Click Save Changes. The network then appears in the second Network table.

Step 4. (Optional) Configure the Login Page

On the USERS > Guest Access page, you can configure the page that is displayed to guests when they log into the network.

In the **Login Page Options** section, edit the **Welcome Message** and upload a **Welcome Image**. The image cannot be larger than 1 MB and must be in JPG, GIF, or PNG format. The suggested image size is 170 x 40 pixels.

How to Set Up Guest Access with Ticketing

Required Version

The Barracuda Firewall version 6.1.2 or newer is required.

When you configure a guest network, you can set up a login or ticketing system to temporarily grant access to guests. Before guests can access the network, they must

enter a username and password from tickets that are assigned to them. The tickets expire after a set period of time.

Before tickets can be created, you must configure the ticketing system and set up ticket administrators. Follow the instructions in this article to set up a guest network with ticketing.

Related Articles • How to Configure Wi-Fi • How to Configure the DHCP Server • How to Manage Guest Tickets User's Guide

In this article:

- · Before You Begin
- Step 1. Set up the Guest Network Interface
 - On a Wi-Fi Interface
 - On a Wired Interface
- Step 2. Enable the DHCP Server for Guest Network
- Step 3. Set Up the Ticket Administrators
- Step 4. Set Up the Guest Network
- Step 5. Add a Redirect Firewall Rule
- Step 6. (Optional) Configure the Login Page
- Next Step

Before You Begin

- Ensure that the Barracuda Firewall has one unused network interface (Wi-Fi, Ethernet, or virtual, e.g., ath3, p3, or p3.100).
- Identify the guest network that you want to use (e.g., 192.168.223.0/24).

Step 1. Set up the Guest Network Interface

You can use Wi-Fi or a wired network for guest access.

On a Wi-Fi Interface

If Wi-Fi is available for your Barracuda Firewall model, you can configure a Wi-Fi network for guest access.

- In the Static Interface Configuration section, ensure that you specify the following settings:
 - **Network** The guest network (e.g., 192.168.223.0/24).
 - Services to Allow Select DNS Server.
 - Classification Click Trusted.

On a Wired Interface

Configure a static network interface. In the Static Interface Configuration, ensure that you specify the following settings:

• Network -- The guest network (e.g., 192.168.223.0/24).

- Services to Allow Select DNS Server.
- Classification Click Trusted.

Step 2. Enable the DHCP Server for Guest Network

To automatically assign IP addresses for guests, enable a DHCP server for the guest network.

- 1. Go to the **NETWORK > DHCP Server** page.
- 2. In the **DHCP Server** section, enable the DHCP server.
- 3. In the Add DHCP Server Subnet section, configure the DHCP subnet. Ensure that you specify the following settings:
 - Beginning IP Address and Ending IP Address The range of IP addresses to be assigned to clients. For example, if your guest network is 192.168.223.0/24, the Beginning IP Address is 192.168.223.10 and the Ending IP Address is 192.168.223.250.
 - DNS Server The IP address of the DNS server.
- 4. Click Save Subnet. The guest network subnet appears in the DHCP Server Subnets section.

For more information on setting up a DHCP server, see How to Configure the DHCP Server.

Step 3. Set Up the Ticket Administrators

Ticket administrators can log into the ticketing system to create guest tickets but cannot log into the management interface of the Barracuda Firewall.

Specify the login credentials for the ticketing system and then give ticket administrators all of the information that they require to create tickets.

- 1. Specify the ticketing system login credentials.
 - a. Go to the USERS > Guest Access page.
 - b. In the Ticketing Administrator section, enter the username and password for logging into the ticketing system.
 - c. Click Save Changes.
- 2. Ensure that ticket administrators have the following information:
 - The IP address of the ticketing web interface: http://secondary IP address/lp/cgi-bin/ticketing
 - The How to Manage Guest Tickets User's Guide on how to create guest tickets.

Step 4. Set Up the Guest Network

If you configured the guest network on a wired interface, specify that the network uses ticketing for guest access.

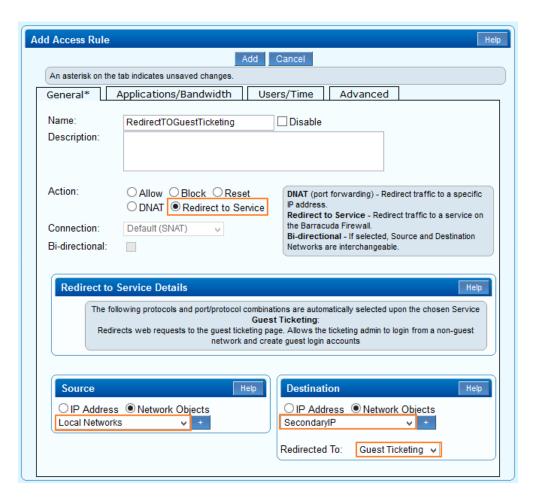

- 1. Go to the **USERS > Guest Access** page.
- 2. In the Guest Networks section, select your guest network (e.g., 192.168.223.1/24) from the Network column.
- 3. From the Type column, select Ticketing.
- 4. For wired interfaces, click Add.
- 5. Click Save Changes. The network appears in the second Network table.

Step 5. Add a Redirect Firewall Rule

Add a Redirect to Service firewall rule with the following settings:

Action	Source	Destination	Redirected To
Redirect to Service	Local Networks	SecondaryIP	Guest Ticketing
		Do not use the management IP address for the ticketing web interface.	

Step 6. (Optional) Configure the Login Page

On the USERS > Guest Access page, you can configure the page that is displayed to guests when they log into the network.

In the **Login Page Options** section, edit the **Welcome Message** and upload a **Welcome Image**. The image cannot be larger than 1 MB and must be in JPG, GIF, or PNG format. The suggested image size is 170 x 40 pixels.

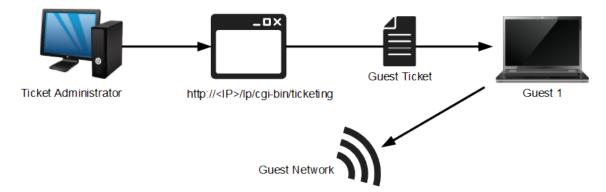

Next Step

For instructions on how to create tickets for guests, see How to Manage Guest Tickets - User's Guide.

How to Manage Guest Tickets - User's Guide

If you are a ticketing administrator, you can create tickets in the Barracuda Firewall ticketing web interface to let guests temporarily access your network.

Tickets assign guests with a username and password that expire after a preset amount of time. After tickets expire, they are automatically deleted.

In this article:

- Before You Begin
- Create a Ticket
- Delete a Guest Ticket
- · Print Ticket Information for Guests

Before You Begin

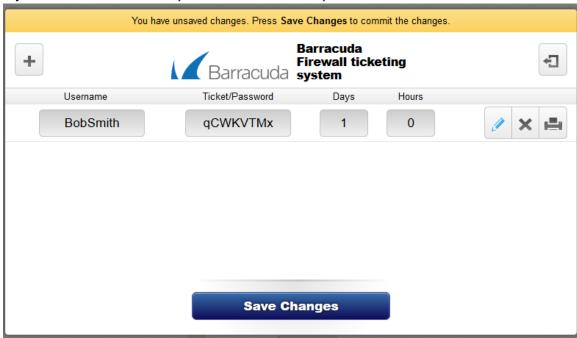

Get the following information from the Barracuda Firewall administrator:

- The IP address of the ticketing web interface (e.g., 192.168.223.1)
- · The username and password for the ticket administrator
- (Wi-Fi only) The SSID and passphrase for the Wi-Fi network

Create a Ticket

To create a guest ticket:

- 1. In a browser, go to:
 - http://IP address for the ticketing web interface/lp/cgi-bin/ticketing
- 2. Log in with the username and password for the ticketing administrator.
- 3. Click the plus sign (+).
- 4. Enter the following information for the guest user:
 - Username A descriptive username (e.g., BobSmith).
 - Password A password.
 - Days and Hours The number of days and hours that the ticket stays valid.

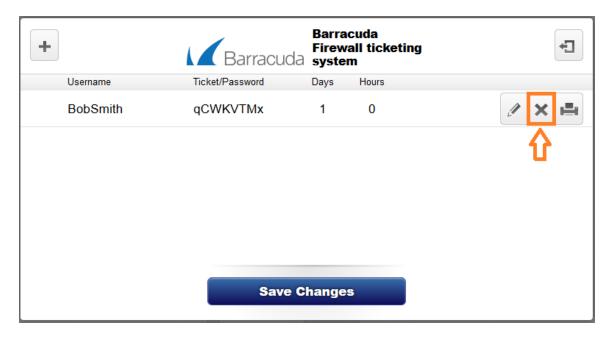

5. Click Save Changes.

Delete a Guest Ticket

To delete a guest ticket before it expires:

- 1. In a browser go to:
 - http://IP address for ticketing web interface/lp/cgi-bin/ticketing
- 2. Next to the ticket that you want to delete, click the X symbol.

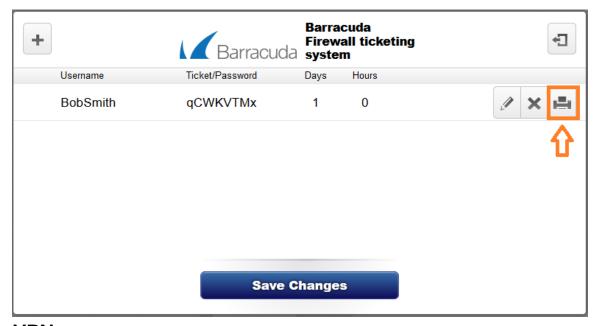

Print Ticket Information for Guests

To give guests their username and password for accessing the network, you can print their ticket information. The printed information also specifies when the ticket expires.

To print the information for a guest ticket, click the printer symbol next to it.

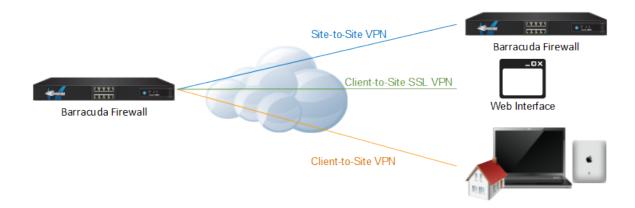

If your guests are accessing a Wi-Fi network, you must also give them the SSID and passphrase for the network.

VPN

VPNs are a secure, efficient, and economical alternative to dedicated lines or dial-up RAS. With the Barracuda Firewall, you can configure the following types of VPNs:

- Site-to-Site VPN Securely and transparently connects remote locations with your network.
- Client-to-Site VPN Lets remote users access the corporate network with VPN clients and mobile devices.
- SSL VPN Lets remote users access corporate resources over a secure and configurable web interface.

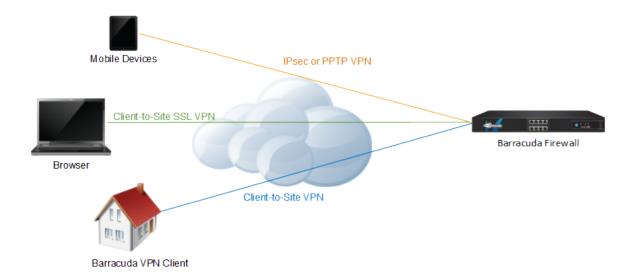

In this Section

- Client-to-Site VPN
 - How to Configure a Client-to-Site VPN with IPsec
 - How to Configure a Client-to-Site VPN with PPTP

- How to Allow VPN Access via a Dynamic WAN IP Address

Client-to-Site VPN

To let remote users access corporate information resources, you can set up a client-to-site VPN. For various VPN client platforms, Barracuda Firewall provides client-to-site IPsec, PPTP, and SSL VPNs.

- Supported VPN Clients
- Configuring Client-to-Site VPNs

Supported VPN Clients

The following table lists the VPN types and clients that can be used with various client platforms:

Client Platform	VPN Types	VPN Clients
Windows	IPsecPPTPSSL VPN	 Barracuda VPN Connector Native Windows PPTP client Third-party IPsec clients
Mac OS X	IPsecPPTPSSL VPN	 Barracuda VPN Client Native OS X PPTP client Third-party IPsec clients
Linux	IPsecPPTPSSL VPN (browser only)	 Barracuda VPN Client Native Linux PPTP client Third-party IPsec clients
Apple iOS	IPsec PPTP Additional Requirement for iOS Version 5.1 and Above For iOS version 5.1 and above, you must configure additional certificates. For more information, see How to Configure Apple iOS Devices for Client-to-Site VPN Connections.	Built-in iOS VPN client
Android	IPsec (Android Version > 4.0)PPTP (Android Version > 2.2)	Built-in Android VPN client

Configuring Client-to-Site VPNs

For instructions on setting up client-to-site VPNs and supported VPN clients, see the following articles:

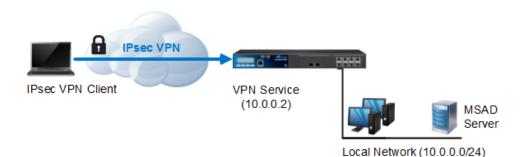

- How to Configure a Client-to-Site VPN with IPsec
- How to Configure a Client-to-Site VPN with PPTP
- How to Configure Apple iOS Devices for Client-to-Site VPN Connections
- How to Configure TheGreenBow VPN Client
- Troubleshooting Client-to-Site VPNs
- How to Enable and Configure SSL VPN for the Barracuda Firewall
- How to Configure SSL VPN Resources for the Barracuda Firewall

How to Configure a Client-to-Site VPN with IPsec

Using VPNs, mobile workers can securely access corporate information and resources. The Barracuda Firewall allows the following types of clients to connect via a client-to-site VPN:

- Laptops and desktops running Windows, Mac OS X, or Linux.
- Apple iPhone 4 and above running iOS version 5.1 and above including the newest version iOS 7.0.
- Mobile phones running Android version 4.0 and above.

Follow the steps in this article to configure a client-to-site IPsec VPN.

In this article:

- Step 1. Identify the User Authentication Mechanism
- Step 2. Configure the Barracuda Firewall VPN Server and Firewall Rule
 - Static WAN IP Address
 - Dynamic WAN IP Address
- Step 3. Configure the VPN Server Certificates
 - Create a Self-Signed Certificate on the Barracuda Firewall
 - Import External Certificates
 - Certificates for iOS Clients
- Step 4. Configure VPN Access Policy
- Step 5. Configure the Client

Step 1. Identify the User Authentication Mechanism

If you want to limit access to specific users and groups:

- Using an external authentication method such as a Microsoft Active Directory, RADIUS, or LDAP server, go to the USERS > External Authentication page. Use these services to authenticate VPN users. You can control access to the VPN by only allowing specific users or groups. For more information how to set up an external authentication method, see How to Integrate with an External Authentication Service.
- Using local authentication, go to the USERS > Local Authentication page. In the Local Users and Groups table, add users and groups.

Step 2. Configure the Barracuda Firewall VPN Server and Firewall Rule

The VPN service that runs on the Barracuda Firewall must listen on an external IP interface (WAN). You must configure the WAN interface and create a firewall rule to grant access to the VPN. Depending on whether VPN connections to the Barracuda Firewall are made to a static or dynamically-assigned WAN IP address, complete the steps in either the following Static WAN IP Address or Dynamic WAN IP Address section.

Static WAN IP Address

To allow VPN connections using a static WAN IP address on the Barracuda FirewallI:

- 1. Go to the **NETWORK > IP Configuration** page.
- In the Static Interface Configuration section, or on any Secondary IP Address of the management IP address, verify that the VPN Server check box for the interface is selected.
- 3. Go to the **FIREWALL > Firewall Rules** page and verify that the pre-installed VPNCLIENTS-2-LAN rule is enabled. You do not have to create a new rule. If VPN access is provided with a static WAN IP address, VPN client traffic is allowed by the VPNCLIENTS-2-LAN rule. This rule allows unrestricted access for VPN clients coming in through interface pvpn0 to the trusted LAN.

VPNCLIENTS-2-LAN Values:

Action	Source	Destination	Service	Interface Group	Connection
Allow	Any	Trusted LAN	Any	VPNClients	No SNAT (the original source IP address is used)

To allow VPN connections using a dynamically assigned WAN IP address on the Barracuda Firewall, follow the steps in How to Allow VPN Access via a Dynamic WAN IP Address.

Step 3. Configure the VPN Server Certificates

For the VPN server to authenticate with the VPN client, either create self-signed certificates on the Barracuda Firewall or import certificates signed by an external Certificate Authority (CA or PKI). If you have iOS clients, configure additional XAUTH certificates.

Create a Self-Signed Certificate on the Barracuda Firewall

To create self-signed certificates on the Barracuda Firewall:

- 1. Go to the VPN > Certificates page.
- 2. In the Certificate Generation section, click Create Certificate.
- 3. In the Create Certificate window, fill in the certificate details and then click Create.

Import External Certificates

If you created the certificate with an external CA, verify that you have the following files:

- · Certificate authority certificate in PEM format.
- · Certificate that is signed by the CA in PKCS12 or PEM format.

To import these external certificates:

- 1. Go to the **VPN > Certificates** page.
- In the Upload Trusted Certificate section, configure the CA certificate settings, select the CA certificate file (e.g., ca-cert-filename.pem), and then click Upload Now. The uploaded CA certificate appears in the Default Certificate section at the top of the page.
- 3. In the **Upload Certificate** section, configure the certificate file settings, select the certificate file (e.g., certificate-filename.pem), and then click **Upload Now**. The uploaded certificate appears in the **Saved Certificate** section.

Certificates for iOS Clients

Additional XAUTH certificates are required by iOS clients. Usually, the default certificate is sufficient for providing identity information from the Barracuda Firewall to the client. However, there are special requirements for iOS clients. For instructions on how to configure and import the XAUTH certificates, see How to Configure Apple iOS Devices for Client-to-Site VPN Connections.

Step 4. Configure VPN Access Policy

Configure a VPN policy to specify which clients are allowed to connect. If there is no policy that matches a client or the policy allowing the client is disabled, the client connection is rejected.

To configure the VPN access policy:

- 1. Go to the VPN > Client-To-Site VPN page.
- 2. Configure the **Settings** section. If you are using iOS devices, select the server certificate from the **Local Certificate** list. Optionally, you can enter a message and select an image to be displayed when the client connects.
- 3. In the IPsec Settings section, configure the IPsec Phase 1 and Phase 2 settings. The Phase 1 encryption settings are global for all clients that want to connect. Phase 2 is chosen when you create the access policy; ensure that you configure the Phase 2 settings. In the VPN Access Policies section, add a policy that defines the network settings. To connect to the VPN service, users and user groups must be included in an access policy.
 - In the policy settings, **Allowed Peers** defines the type of VPN clients that are allowed to connect to the Barracuda Firewall. This can either be the Barracuda Network Access Client or any third-party client that uses default IPsec.

If you set the Allowed Groups when using local authentication, a "Certificate did not match any group" error occurs.

4. Click Save Changes.

For additional assistance, click Help on the Client-To-Site VPN page.

Step 5. Configure the Client

On the IPsec client system, you must enter the following key parameters to establish a connection to the Barracuda Firewall:

Key Parameter	Description

VPN Server	The external IP address or DNS hostname of your Barracuda Firewall.
Encryption	Verifies that the client-side VPN configuration matches the IPsec Phase 1 and Phase 2 settings on the Barracuda Firewall. If the incorrect encryption, hash, or DH group are selected, the client can still reach the VPN server but is unable to communicate. Also, the tunnel cannot be established. Verify that the lifetimes are identical; a mismatch can lead to brief tunnel terminations whenever one side reaches its lifetime. When the lifetimes are correctly configured, renegotiation occurs transparently.
Authentication	The username is case-insensitive, but the password is case-sensitive. If the client cannot connect because of authentication problems, verify that you entered the correct password.

How to Configure a Client-to-Site VPN with PPTP

Using VPNs, mobile workers can securely access corporate information and resources. The Barracuda Firewall allows remote clients running iOS, Android, Windows, Mac OS X, and Linux operating systems to connect via a client-to-site VPN.

Follow the steps in this article to configure a client-to-site VPN using PPTP.

In this article:

- Step 1. Configure the Barracuda Firewall VPN Server
 - Static WAN IP Address
 - Dynamic WAN IP Address
- Step 2. Configure the PPTP Settings on the Barracuda Firewall
- Step 3. Configure User Authentication
 - Local Authentication
 - MS-CHAPv2/NTLM
- Step 4. Add the Firewall Rule to Allow Traffic Between VPN Clients and LAN
- Step 5. Verify the Order of the Firewall Rules

Step 1. Configure the Barracuda Firewall VPN Server

The VPN server that runs on the Barracuda Firewall must listen on the appropriate IP address for the clients. Depending on whether the Barracuda Firewall is connected to the Internet through an ISP that statically or dynamically assigns the WAN IP address, complete the steps in the Static WAN IP Address or Dynamic WAN IP Address section.

Static WAN IP Address

If the Barracuda Firewall is connected to the Internet through an ISP that statically assigns the WAN IP address:

- 1. Go to the **NETWORK > IP Configuration** page.
- In the Static Interface Configuration section, or on any Secondary IP Address of the management IP address, verify that the VPN Server check box for the interface is selected.

Dynamic WAN IP Address

To allow VPN connections using a dynamically assigned WAN IP address on the Barracuda Firewall, follow the steps in How to Allow VPN Access via a Dynamic WAN IP Address.

Step 2. Configure the PPTP Settings on the Barracuda Firewall

Configure PPTP to let remote devices access the Barracuda Firewall VPN.

- 1. Go to the VPN > PPTP page.
- 2. In the PPTP Settings section, enable and configure PPTP.
- 3. On the same page, configure the user authentication method:
 - For local authentication, configure the settings in the **Local PPTP Users** section.
 - For MS-CHAPv2 and NTLM authentication, configure the settings in the User and Group Conditions (MS-CHAPv2/NTLM) section.

For more information on the PPTP and authentication settings, click Help on the VPN > PPTP page.

Step 3. Configure User Authentication

For user authentication, you can use local authentication or MS-CHAPv2/NTLM.

Local Authentication

To configure user access permissions with Local Authentication:

- 1. Go to the VPN > PPTP page.
- 2. In the **Local PPTP User** section, add the username and password for each user who is allowed to connect to the VPN. If required, specify a static IP address for the user.
- 3. Click Save Changes.

MS-CHAPv2/NTLM

With MS-CHAPv2/NTLM, you can allow access on a per-user or per-group basis.

- 1. Go to the VPN > PPTP page.
- In the User and Group Conditions (MS-CHAPv2/NTLM) section, add the users and groups who are allowed to connect to the client-to-site VPN.
- 3. Click Save Changes.

Step 4. Add the Firewall Rule to Allow Traffic Between VPN Clients and LAN

Create a new firewall rule to let PPTP traffic in the VPN tunnel pass between the VPN clients and the trusted LAN. The pre-installed VPNCLIENTS-2-LAN firewall rule does not match PPTP connections because they do not use the pvpn0 virtual interface. As a result, PPTP traffic is blocked by default.

Create a new firewall rule that lets VPN traffic from the PPTP clients access the Trusted LAN:

1. Go to the FIREWALL > Firewall Rules page and add this rule:

Action	Source	Destination	Service	Connection
Allow	The network range assigned to the PPTP clients (configured in V PN > PPTP > Client IP Pool Begin/Client IP Pool Size)	Trusted LAN	Any (or the allowed/required services)	No SNAT (the original source IP address is used)

2. At the top of the Add Access Rule window, click Add.

Step 5. Verify the Order of the Firewall Rules

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

How to Configure Apple iOS Devices for Client-to-Site VPN Connections

Recommended iOS Version Upgrade

Because certificates longer than 512-bit do not work for iOS VPN clients with iOS version 6.0, it is recommended that you update to the latest version of iOS.

For iOS client devices such as an iPhone or an iPad, you must configure additional certificates. Due to restrictions of iOS, you must use a certificate and XAUTH. After creating the required certificates, import them onto the Barracuda Firewall and iOS device. You must also add the VPN connection on the iOS device. Any iOS device with version 5.2.3 and above (including iOS 7.0) is supported.

In this article:

- Certificate Requirements
- Step 1. Create the Required Certificates
 - Example iOS Certificate Settings
 - Root Certificate
 - Server Certificate
 - Client Certificate
- Step 2. Import Certificates into the Barracuda Firewall
- Step 3. Add the VPN Connection on the iOS Device
- Next Step

Certificate Requirements

Because certificate-based authentication is required, you must have three types of X.509 certificates that come with a valid chain of trust. The following table lists the required X.509 certificates, their settings, and where they must be installed:

X.509 Certificate Type	Where to Install	File Type	Chain of Trust	X.509 Extensions and Values
Root Certificate	Barracuda Firewall & Apple iOS Device	PEM	Trust Anchor	Mandatory option for key usage: Certificate sign; CRL sign.
Server Certificate	Barracuda Firewall	PKCS12	End Instance	Key Usage - Include the "Digital Signature" flag. Subject Alternative Name - DNS hostname. Examples: DNS: vpn.yo urdomain.com Note: The hostname must be DNS resolvable.
Client Certificate	Apple iOS Device	PKCS12	End Instance	Key Usage – Include the "Digital Signature" flag.

If CA-signed X.509 certificates are not available, you can use self-signed certificates instead. These certificates must also have a valid chain of trust. Typically, X.509 certificates are created through a Public Key Infrastructure (PKI) that allows creating, signing, or revoking certificates. Examples include Microsoft's PKI with Active Directory, and XCA - X Certificate and key management.

Step 1. Create the Required Certificates

Create the required certificates. If you want to create the certificates with XCA, see How to Create Certificates with XCA.

If you have problems with your certificates, compare your settings with those of the following example certificate settings. Especially verify the **X50 9 Basic Constraints** and **X509v3 Key Usage** settings.

Example iOS Certificate Settings

Root Certificate

Tab	Setting	Value
Status	Signature Algorithm	sha1WithRSAEncryption
Subject	RFC 2253	emailAddress=support@barracuda.com,O U=documentation,O=Barracuda Networks,L=Innsbruck,ST=Tirol,C=AT
	Hash	7b6d2374
Extensions	X509v3 Basic Constraints	CA:TRUE
	X509v3 Key Usage	Digital Signature, Key Agreement, Certificate Sign

Server Certificate

Tab	Setting	Value
Status	Signature Algorithm	sha1WithRSAEncryption
Subject	RFC 2253	emailAddress=support@barracuda.com,O U=docu,O=Barracuda Network AG,L=Innsbruck,ST=Tyrol,C=AT
	Hash	cc0460b5
Issuer	RFC 2253	emailAddress=support@barracuda.com,O U=documentation,O=Barracuda Networks,L=Innsbruck,ST=Tirol,C=AT
	Hash	7b6d2374
Extensions	X509v3 Key Usage	Digital Signature, Key Agreement, Certificate Sign
	X509v3 Subject Alternative Name:	DNS:vpnserver.yourdomain.com

Client Certificate

Tab	Setting	Value
Status	Signature Algorithm	sha1WithRSAEncryption
Subject	RFC 2253	emailAddress=support@barracuda.com,O U=documentation,O=Barracuda Networks,L=Innsbruck,ST=Tyrol,C=AT
	Hash	c2b06d20
Issuer	RFC 2253	emailAddress=support@barracuda.com,O U=documentation,O=Barracuda Networks,L=Innsbruck,ST=Tirol,C=AT
	Hash	7b6d2374
Extensions	X509v3 Key Usage	Digital Signature

Step 2. Import Certificates into the Barracuda Firewall

Import the required certificates into the Barracuda Firewall.

1. Go to the **VPN > Certificates** page.

- 2. In the Upload Certificate section, upload the root and server certificates. Ensure that they have unique names.
- 3. If needed, upload intermediary certificates.
- 4. Configure the remaining settings.

Step 3. Add the VPN Connection on the iOS Device

On the iOS device, import the root and client certificates. You can import the certificate via email or by downloading it from a web server.

To create a new VPN connection on the iOS device:

- 1. On the iOS device, tap Settings > General > VPN > Add VPN Configuration.
- 2. On the Add VPN Configuration screen, tap the IPsec tab.
- 3. Specify the following settings:
 - Server The Subject Alternative Name used in your certificates.
 - Account and Password The XAUTH username and password.
 - Use Certificate Enable this setting.
 - Certificate The X.509 client certificate.

Next Step

If you are configuring a client-to-site VPN with IPsec, see How to Configure a Client-to-Site VPN with IPsec.

How to Configure TheGreenBow VPN Client

For client-to-site VPN connections with the Barracuda NG Firewall and the Barracuda Firewall, you can use TheGreenBow VPN client for Windows. Follow the steps in this article to configure TheGreenBow client for use with the Barracuda NG Firewall.

In this article:

- · Before You Begin
- Step 1. Configure Phase 1
- Step 2. Configure Phase 2
- Step 3. Disable Mode Config

External Resource

TheGreenBow homepage at www.thegreen bow.com ...

Alternative VPN Clients Offered by Barracuda Networks

If simple IPsec tunneling as offered by TheGreenBow is not sufficient for your needs, consider the Barracuda VPN and Network Access Clients. Different Barracuda Networks clients are available for Windows, Mac OS X, and Linux. Suitable server-side functionality is included with the Barracuda Firewall and Barracuda NG Firewall, which also offers Access Control.

The Barracuda VPN and Network Access Clients offer numerous authentication methods, remote deployment and administration, quick restoration of VPN tunnels after dropped connections, 'Always On' VPN connections for PCs, support for redundant VPN gateways, selective routing of network traffic through the tunnel, automatic selection of the optimal VPN gateway based on the client's location, and much more. When you use a Barracuda NG Firewall as the VPN gateway, you can also centrally deploy and manage the Windows clients.

For more information, see Barracuda VPN / Network Access Clients - Overview.

Before You Begin

On the Barracuda NG Firewall or Barracuda Firewall, verify that the VPN service for standard IPsec client-to-site connections has been properly configured. You will use the encryption and authentication settings of the VPN server to configure the TheGreenBow client.

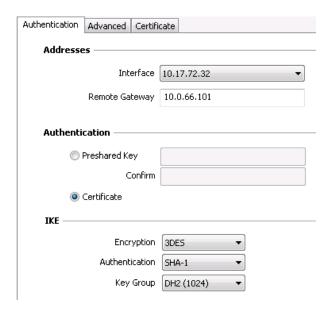

For more information on configuring the VPN service for the Barracuda Firewall, see How to Configure a Client-to-Site VPN with IPsec.

It is assumed that you are using the default settings for TheGreenBow VPN client. If you have already modified any settings for the client, either restore the default settings or uninstall and then reinstall the client before completing the following steps.

Step 1. Configure Phase 1

To configure Phase 1:

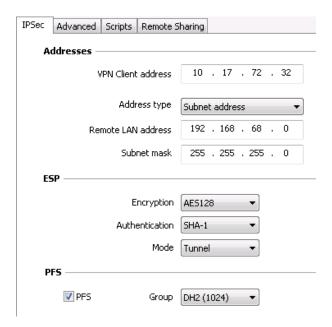

- 1. From the left menu of TheGreenBow client, right-click VPN Configuration and select New Phase 1.
- 2. If you want to rename the **Gateway** entry that was created, right-click it and select **Rename**. For example, you can rename the entry as P hase 1.
- 3. Click the **Gateway** entry and then click the **Authentication** tab.
- 4. In the Addresses section, type the server IP address of the VPN service into the Remote Gateway field.
- 5. In the Authentication section, define a Preshared Key or a Certificate as required.
- 6. If applicable, import or select a certificate from the Certificate tab. Then click the Advanced tab and enter the necessary settings.
- 7. In the IKE section, adjust the settings as required. These settings must match the settings that are used by the VPN service.

Step 2. Configure Phase 2

To configure Phase 2:

- 1. In the left menu, right-click the Gateway entry (that you might have renamed to e.g. Phase 1) and select New Phase 2.
- 2. If you want to rename the **Tunnel** entry that was created as a child of the **Gateway** entry, right-click it and select **Rename**. For example, you can rename it as Phase 2.
- 3. Click the **Tunnel** entry and then click the **IPSec** tab.
- 4. In the Addresses section, select Subnet address as the Address type.
- 5. In the remaining fields of the Addresses section, enter the network settings that were configured for the VPN service.
- 6. In the **ESP** section, select the settings that are used by the VPN service.

Step 3. Disable Mode Config

To disable the Mode Config:

1. Go to **Gateway > Advanced** tab **> Advanced features**, and verify that that the **Mode Config** check box is cleared. Mode Config is a feature of certain routers to remotely configure the client's IP addressing, which is not required in this setup.

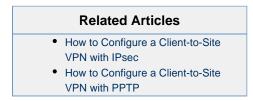

You can now initiate a connection by navigating to Tools > Connection Panel. For more information, see TheGreenBow's help system.

Troubleshooting Client-to-Site VPNs

If your client-to-site VPN is not working as expected, try the solutions that are provided in this article for the following scenarios:

- You Receive a Timeout Error on the Client
- · You Receive an Authentication Error on the Client
- You are Able to Connect but Cannot Reach the Published Networks

You Receive a Timeout Error on the Client

- The client might not be able to reach the public listen IP address of the Barracuda Firewall. Try to ping the
 public listen IP address of the appliance from the client.
- Go to the VPN > Client-to-Site VPN page and verify that the tunnel is configured correctly.

You Receive an Authentication Error on the Client

- · Go to the VPN > Client-to-Site VPN page and verify that the correct user authentication method is selected.
- Go to the Users > External Services page and verify that the external authentication method is correctly configured.
- Ensure that the correct username and password are being used to log in.
- Verify that special characters are not being used in the password. If there are any special characters, change the password and then try to connect.

You are Able to Connect but Cannot Reach the Published Networks

- On the client, see if traffic is being sent into the tunnel. You can either check the routing table of the client machine or use the tracert a nd traceroute command-line utilities.
- · Go to the VPN > Client-to-Site VPN page and verify that the VPN Access Policies are configured correctly.
- Ensure that the firewall rule for the VPN is allowing the traffic into the networks.

Site-to-Site VPN

Site-to-site VPNs let offices in multiple locations establish secure connections with each other over a public network such as the Internet. A site-to-site VPN extends the company's network, making resources available to remote employees. The Barracuda Firewall establishes strongly encrypted IPsec VPN tunnels, using DES, 3DES, AES-128, AES-256, etc. It supports active and passive tunnel initiation and provides maximum flexibility.

Configuring Site-to-Site VPNs

For instructions on setting up site-to-site VPNs, see the following articles:

- How to Configure a Site-to-Site VPN with IPsec
- Example Configuring a Site-to-Site IPsec VPN Tunnel
- Troubleshooting Site-to-Site VPNs

How to Configure a Site-to-Site VPN with IPsec

The Barracuda Firewall can establish IPsec VPN tunnels to any other appliance supporting the IPsec VPN protocol, including another Barracuda Firewall. To set up the IPsec VPN tunnel, you must create it on the Barracuda Firewall and its remote appliance. For a successful IPsec tunnel, configure identical Phase 1 and Phase 2 settings on both VPN gateways. The Barracuda Firewall supports authentication with a shared passphrase as well as X.509 certificate-based (CA-signed as well as self-signed) authentication. You must also configure a firewall rule to allow traffic between both networks.

In this article:

- Step 1. Create the IPsec Tunnel on the Barracuda Firewall and on the Remote appliance
- Step 2. Configure the Barracuda Firewall VPN Server
 - Static WAN IP Address
 - Dynamic WAN IP Address
- Step 3. Create the Firewall Rule for VPN Traffic

- Step 4. Verify the Order of the Firewall Rules
- Step 5. Verify Successful VPN Tunnel Initiation and Traffic Flow

Related Article Example - Configuring a

Step 1. Create the IPsec Tunnel on the Barracuda Firewall and on the Remote appliance

To create the IPsec tunnel on the Barracuda Firewall:

Site-to-Site IPsec VPN Tunnel

- 1. Go to the VPN > Site-to-Site Tunnels page.
- 2. In the Site-to-Site IPSec Tunnels section, click Add.
- 3. On the Add Site-to-Site IPsec Tunnel page, configure the settings. The Phase 1 and Phase 2 settings must be identical on both VPN gateways.
- 4. After configuring the tunnel settings, click Save.
- 5. Configure the IPsec tunnel on the remote appliance.

Step 2. Configure the Barracuda Firewall VPN Server

The VPN server that runs on the Barracuda Firewall must listen on the appropriate IP address for its peer. Depending on whether the Barracuda Firewall is connected to the Internet through an ISP that statically or dynamically assigns the WAN IP address, complete the steps in the following Static WAN IP Address or Dynamic WAN IP Address section.

Static WAN IP Address

If the Barracuda Firewall is connected to the Internet through an ISP that statically assigns the WAN IP address:

- 1. Go to the **NETWORK > IP Configuration** page.
- In the Static Interface Configuration section, verify that the VPN Server check box is selected for the interface or for any Secondary IP
 Address of the management IP address.

Dynamic WAN IP Address

If your Barracuda Firewall is connected to the Internet through an ISP that dynamically assigns the WAN IP address, see Allowing VPN Access via Dynamic WAN IP Address.

Step 3. Create the Firewall Rule for VPN Traffic

Create a firewall rule to allow network traffic between the two networks. If the tunnel is to be established between two Barracuda Firewalls, create the same rule on *both* appliances.

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Add a firewall rule with the following settings:

Action	Connection	Bi-directional	Service	Source	Destination
Allow	No SNAT (the original source IP address is used)	Select the Bi-direc tional check box.	Any	The LAN 1 address.	The LAN 2 address.

3. At the top of the Add Access Rule window, click Add.

Step 4. Verify the Order of the Firewall Rules

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, ensure that you arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked. If you are configuring a tunnel between two Barracuda Firewalls, verify the order of the firewall rules in the rule sets for both appliances.

After adjusting the order of rules in the rule set, click Save Changes.

Step 5. Verify Successful VPN Tunnel Initiation and Traffic Flow

To verify that the VPN tunnel was initiated successfully and traffic is flowing, go to the **VPN > Site-to-Site Tunnels** page. Verify that green check marks are displayed in the **Status** column of the VPN tunnel.

Use ping to verify that network traffic is passing the VPN tunnel. Open the console of your operating system and ping a host within the remote network. If no host is available, you can ping the management IP address of the remote Barracuda Firewall. Go to the **NETWORK > IP Configuration** page and ensure that **Services to Allow: Ping** is enabled for the management IP address of the remote firewall.

If network traffic is not passing the VPN tunnel, go to the **BASIC > Recent Connections** page and ensure that network traffic is not blocked by any other firewall rule.

Example - Configuring a Site-to-Site IPsec VPN Tunnel

This article provides an example of how to configure an IPsec VPN tunnel between two Barracuda Firewalls with shared passphrase authentication. The example uses the following networks and default VPN tunnel settings:

IP Addresses	Location 1	Location 2
Local Networks	10.10.10.0/24	10.10.20.0/24
Local Address	212.86.0.253	213.47.0.253

Tunnel Settings	Location 1	Location 2
Tunnel initiation	Active	Passive
Encryption Phase 1 & 2	AES256	
Hash Method Phase 1 & 2	MD5	
DH Group Phase 1 & 2	Group 1	
Lifetime Phase 1	28800	
Lifetime Phase 2	3600	
Authentication	Shared Passphrase	

In this article:

- Step 1. Create the IPsec Tunnel on the Barracuda Firewall at Location 1
- Step 2. Create the IPsec Tunnel on the Barracuda Firewall at Location 2
- Step 3. Configure the Firewall Rule for VPN Traffic
- Step 4. Verify the Order of the Firewall Rules
- Step 5. Verify Successful VPN Tunnel Initiation and Traffic Flow

Step 1. Create the IPsec Tunnel on the Barracuda Firewall at Location 1

To create the IPsec tunnel:

- 1. Log into the Barracuda Firewall at Location 1.
- 2. Go to the VPN > Site-to-Site Tunnels page.
- 3. In the Site-to-Site IPSec Tunnels section, click Add.
- 4. Enter a Name for the new VPN tunnel.
- 5. In the Phase 1 and Phase 2 sections, specify these settings:

Setting	Value
Encryption Phase 1 & 2	Select AES256.
Hash Method Phase 1 & 2	Select MD5.
DH Group Phase 1 & 2	Select Group 1.
Lifetime Phase 1	Enter 28800.

Lifetime Phase 2	Enter 3600.

6. Specify these network settings:

Setting	Value
Local End	Select Active.
Local Address	Select one of the available IP addresses. If you have dynamic ISPs configured, select Dynamic .
Local Networks	Enter 10.10.10.0/24.
	The network address for the locally configured LAN.
Remote Address	Enter 213.47.0.253.
	The WAN IP address of location 2.
Remote Networks	Enter 10.10.20.0/24.
	The remote LAN.

7. Specify these authentication settings:

Setting	Value
Authentication	Select Shared Passphrase.
Passphrase	Enter the shared secret.

8. Click Add.

Step 2. Create the IPsec Tunnel on the Barracuda Firewall at Location 2

To create the IPsec tunnel:

- 1. Log into the Barracuda Firewall at Location 2.
- 2. Go to the **VPN > Site-to-Site Tunnels** page.
- 3. In the Site-to-Site IPSec Tunnels section, click Add.
- 4. Enter a **Name** for the new VPN tunnel.
- 5. In the **Phase 1** and **Phase 2** sections, specify these settings:

Setting	Value
Encryption Phase 1 & 2	Select AES256.
Hash Method Phase 1 & 2	Select MD5.
DH Group Phase 1 & 2	Select Group 1.
Lifetime Phase 1	Enter 28800.
Lifetime Phase 2	Enter 3600.

6. Specify these network settings:

Setting	Value
Local End	Select Passive.
Local Address	Select one of the available IP addresses. If you have dynamic ISPs configured, select Dynamic .

Local Networks	Enter 10.20.10.0/24.
	The network address for the locally configured LAN.
Remote Address	Enter 213.47.0.253.
	The WAN IP address of location 1.
Remote Networks	Enter 10.10.10.0/24.
	The remote LAN.

7. Specify these authentication settings:

Setting	Value	
Authentication	Select Shared Passphrase.	
Passphrase	Enter the shared secret.	

8. Click Add.

Step 3. Configure the Firewall Rule for VPN Traffic

To allow network traffic between both networks, create a firewall rule. You must create the same rule on both Barracuda Firewalls.

This example configures a firewall rule to allow traffic between the 10.0.10.0/24 and 10.0.20.0/24 networks.

- 1. Log into the Barracuda Firewall at Location 1.
- 2. Go to FIREWALL > Firewall Rules page.
- 3. Add a firewall rule with the following settings:

Action	Connection	Bi-directional	Service	Source	Destination
Allow	No SNAT	Select the Bi-direc tional check box.	Any	10.0.10.0/24	10.0.20.0/24

With the **Any** service object, all types of network traffic are allowed between the remote and local network. For VPN tunnels, you must select the **No SNAT** connection object.

- 4. At the top of the Add Access Rule window, click Add.
- 5. Log into the Barracuda Firewall at Location 2 and repeat steps 2 to 4.

Step 4. Verify the Order of the Firewall Rules

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, ensure that you arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked. Check the order of the firewall rules in the rule sets for both Barracuda Firewalls.

After adjusting the order of rules in the rule set, click Save Changes.

Step 5. Verify Successful VPN Tunnel Initiation and Traffic Flow

To verify that the VPN tunnel was initiated successfully and traffic is flowing, go to the **VPN > Site-to-Site Tunnels** page. Verify that green check marks are displayed in the **Status** column of the VPN tunnel.

Use ping to verify that network traffic is passing the VPN tunnel. Open the console of your operating system and ping a host within the remote network. If no host is available, you can ping the management IP address of the remote Barracuda Firewall. Go to the **NETWORK > IP Configuration** page and ensure that **Services to Allow: Ping** is enabled for the management IP address of the remote firewall.

If network traffic is not passing the VPN tunnel, go to the **BASIC > Recent Connections** page and ensure that network traffic is not blocked by any other firewall rule.

Troubleshooting Site-to-Site VPNs

If your site-to-site VPN is not working correctly, try the solutions that are listed in this article.

Related Articles

- How to Configure a Site-to-Site VPN with IPsec
- Example Configuring a Site-to-Site IPsec VPN Tunnel
- Ensure that the Internet connection for both systems is active.
- To verify that the VPN tunnel was initiated successfully and traffic is flowing, go to the VPN > Site-to-Site Tunnels page. Verify that green check marks are displayed in the Status column of the VPN tunnel.
- Double-check the VPN configuration for both systems (Lifetime, Enycrption, Hash-Method, DH-Group, Local and Remote Networks, Local and Remote Address, and Passphrase). Go to the VPN > Site-to-Site Tunnels page and verify the tunnel settings. The configurations of the peers must match or the tunnel cannot be established.
- Go to the LOGS > VPN Log page. Search the log for any failures and errors. Often, the problem is caused by Phase 1 and Phase 2 issues.
- From a client in the local network, ping a host in the remote network. If no host is available, try to ping the management IP address of the
 remote Barracuda Firewall. If that does not succeed, go to the NETWORK > IP Configuration page on the remote Barracuda Firewall
 and ensure that Services to Allow: Ping is enabled for the management IP address.
- View the the BASIC > Recent Connections page to verify that the correct firewall rule matches the traffic.
- Using the tracert and traceroute command-line utilities, determine where traffic is being sent. You can begin a traceroute from the
 Network Connectivity Tests section on the ADVANCED > Troubleshooting page. If traffic is being sent to the remote network but you
 are not getting a reply, verify that the gateway of the remote network is the IP address of the remote Barracuda Firewall.

SSL VPN for the Barracuda Firewall

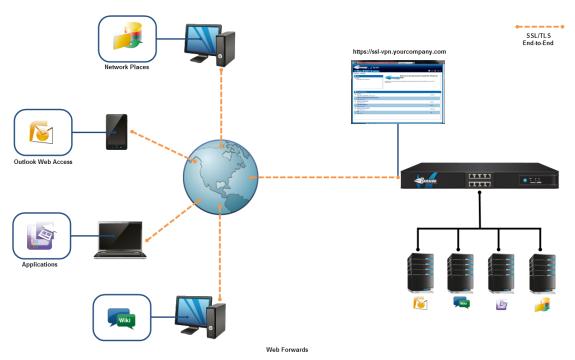

Version Info

This feature is available on the Barracuda Firewall X200 and above, with version 6.1.0 and higher.

With the SSL VPN for the Barracuda Firewall, you can grant users with secure SSL/TLS-encrypted access to internal corporate resources and applications through a customizable web interface.

- Client Requirements
- Configuring SSL VPNs

Client Requirements

To access the VPN via the SSL VPN portal, users' workstations must fulfill the following requirements:

- Java Runtime version 1.6 and above must be installed. This is required to run the browser-based Java applet, generic tunneling, and the Barracuda NG SSL VPN client.
- Supported web browsers are Microsoft Internet Explorer version 6 or above, and Firefox version 2 or above.

Configuring SSL VPNs

For instructions on setting up SSL VPNs, see the following articles:

- How to Enable and Configure SSL VPN for the Barracuda Firewall
- How to Configure SSL VPN Resources for the Barracuda Firewall

How to Enable and Configure SSL VPN for the Barracuda Firewall

Before your end users can access the SSL VPN, you must enable and configure it. To establish the SSL VPN portal as trustworthy, it is recommended that you install a CA-trusted root certificate on the Barracuda Firewall. For transparent access, you can enable the SSL VPN client.

In this article:

- Enable the SSL VPN
 - Static IP Address
 - · Secondary IP Address
 - Dynamic Network Interface
- Configure User Authentication
- Configure the SSL VPN Portal
- Upload a Certificate
- Enable the SSL VPN Client
- Next Steps

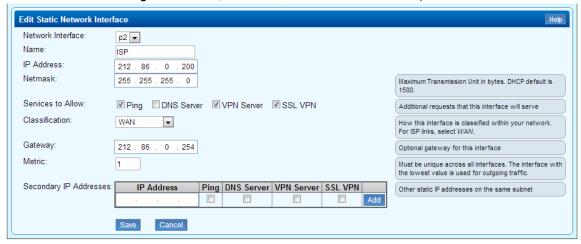

Enable the SSL VPN

When you enable the SSL VPN portal, determine if you are using a static, dynamic, or secondary IP address for the portal. Typically, the SSL VPN portal is deployed on a static WAN IP address that faces the Internet with a respective DNS A resource record. The portal can also use a secondary IP address of the Barracuda Firewall for internal access.

Static IP Address

If you are using a static IP address:

- 1. Go to the **Network > IP Configuration** page.
- 2. In the Static Interface Configuration section, select the SSL VPN check box for the required interface.

3. Click Save Changes.

Secondary IP Address

Typically, a secondary IP address is used to provide the SSL VPN portal on internal network segments.

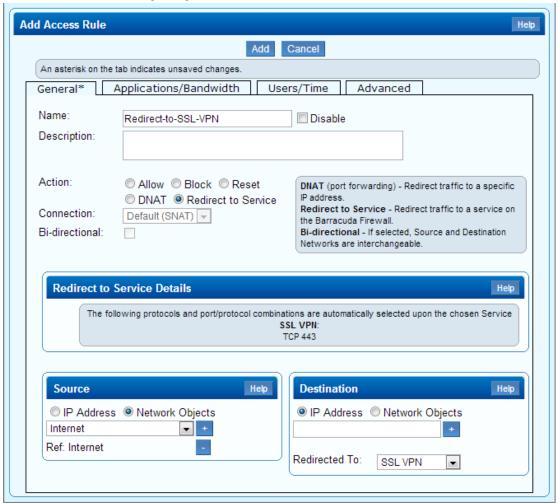

If you are using a secondary IP address:

- 1. Go to the **Network > IP Configuration** page.
- In the Management IP Configuration section, select the SSL VPN check box next to the required IP address in the Secondary IP Addresses table.
- 3. Click Save Changes.

Dynamic Network Interface

To serve the SSL VPN portal on a dynamic interface instead of a static IP address, also complete the following steps:

- 1. Go to the FIREWALL > Firewall Rules page.
- 2. Add a firewall rule with the following settings:

- 3. To enable access to the SSL VPN portal via a hostname instead of only via the IP address (because the latter may change), you can use the third-party DynDNS service.
 - a. Go to the **NETWORK > IP Configuration** page.
 - b. In the Dynamic Interface Configuration, enable Use Dynamic DNS for the required interface.
- 4. Click Save Changes.

Configure User Authentication

End users must authenticate themselves before they can access internal resources and applications with the SSL VPN. You can manage user authentication either locally on the Barracuda Firewall or externally with MS Active Directory, LDAP, or RADIUS. For instructions on how to configure local or external user authentication on the Barracuda Firewall, see Managing Users and Groups.

To specify how users are authenticated for the SSL VPN, go to the VPN > SSL VPN > Authentication page and select the method from the Use r Authentication list.

Configure the SSL VPN Portal

After you enable SSL VPN and specify the authentication method, configure general and appearance settings:

- 1. Go to the VPN > SSL VPN page and click the Server Settings tab.
- 2. In the General Settings section, specify the basic settings for the SSL VPN.
 - For increased security, Barracuda Networks recommends that you enable Enforce Strong Ciphers.
 - By default, the SSL VPN portal does not accept SSLv2 connections because SSLv2 is considered unsafe. If you must allow SSLv2 connections for compatibility reasons, enable Allow SSLv2.
 - To prevent browsers from saving SSL VPN session information and cookies, disable Allow Autocomplete.
- 3. In the Appearance section, customize the look of the SSL VPN portal.

Upload a Certificate

It is recommended that you install a CA-trusted root certificate on the Barracuda Firewall, so that web browsers trust the SSL VPN portal and do not issue a warning to end users when they access the portal. If a certificate is not installed, the SSL VPN portal page delivers the default self-signed certificate.

To upload a certificate, go to the **VPN > Certificates** page. You can upload a new certificate or select one that has already been uploaded from the **Certificate** list.

Enable the SSL VPN Client

For transparent VPN access, end users can launch the SSL VPN client by clicking the **My Network** link in the upper right of the SSL VPN portal. After users are authenticated, they are given access to the target network.

To enable the SSL VPN client:

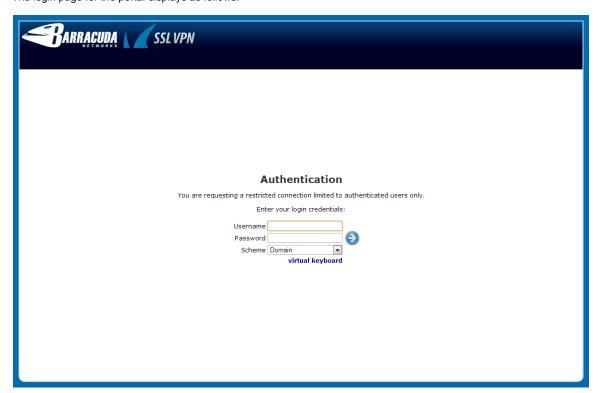

- 1. Go to the VPN > SSL VPN page and click the Client Settings tab.
- 2. In the SSL VPN Client Settings section, set Enabled to Yes.
- 3. Configure the remaining settings.

Next Steps

After you enable and configure the SSL VPN, end users can access the portal in their web browsers. If an A resource record for the WAN IP address of your Barracuda Firewall is assigned, end users can access the portal page by opening https://example.com.

To add resources for your end users to the SSL VPN portal, see How to Configure SSL VPN Resources for the Barracuda Firewall.

The login page for the portal displays as follows:

How to Configure SSL VPN Resources for the Barracuda Firewall

After you enable and configure the SSL VPN, you can add Outlook Web Access (OWA), WebDAV shares, applications, and Intranet resources to the SSL VPN portal.

In this article:

- Configure Outlook Web Access / Outlook Web App
- Add an Application
- Add a WebDAV Share
- Add an Intranet Resource

Configure Outlook Web Access / Outlook Web App

To give your end users direct access to the corporate email resources, configure an Outlook Web Access / Outlook Web App (OWA) resource. The OWA applet also supports single sign-on so that end users do not need to repeatedly re-authenticate themselves.

To configure OWA:

- 1. Go to the VPN > SSL VPN page and click the Portal Settings tab.
- 2. In the Outlook Web Access section, set Enabled to Yes.
- 3. Configure the remaining settings in the Outlook Web Access section.

Add an Application

The Barracuda Firewall's SSL VPN supports the following application protocols:

- SMB
- RDP
- Telnet
- SSH
- SMTP
- POP3
- VNC
- IMAP4

To add an application:

- 1. Go to the VPN > SSL VPN page and click the Portal Settings tab.
- 2. In the Applications section, click Add Application.
- 3. In the Edit Application window, configure access to the application.

Add a WebDAV Share

To give direct access to WebDAV share, add a network place:

- 1. Go to the VPN > SSL VPN page and click the Portal Settings tab.
- 2. In the Network Places section, click Add Network Place.
- 3. In the Edit Network Place window, configure access to the network share.

Add an Intranet Resource

To give direct access to an Intranet resource, add a web forward:

- 1. Go to the VPN > SSL VPN page and click the Portal Settings tab.
- 2. In the Web Forwards section, click Add Web Forward.
- 3. In the Edit Web Forward window, configure access to the Intranet resource.

How to Allow VPN Access via a Dynamic WAN IP Address

You can configure VPN connections to use a dynamically assigned WAN IP address on the Barracuda Firewall. In the VPN settings, enable use of dynamic IP addresses. Then configure a firewall rule that redirects VPN traffic to the VPN server.

In this article:

- Step 1. Configure VPN Access via a Dynamic WAN IP Address
- Step 2. Verify the Order of the Firewall Rules

Related Articles

- How to Configure a Client-to-Site VPN with PPTP
- How to Configure a Site-to-Site VPN with IPsec
- How to Configure a Client-to-Site VPN with IPsec

Step 1. Configure VPN Access via a Dynamic WAN IP Address

To allow VPN access via a dynamic WAN IP address:

- 1. On the VPN > Site-to-Site Settings page, in the IKE (Key Exchange) section, verify that Use Dynamic IPs is set to Yes.
- 2. If you want to make your VPN available through a DNS hostname, you can register the hostname with http://d yn.com/dns. For more information, see How to Configure a DHCP Connection.
- 3. Create a new firewall rule that redirects the VPN traffic to the VPN server to establish the tunnel:
 - a. Go to the FIREWALL > Firewall Rules page.
 - b. Create a firewall rule that redirects connections to your DHCPx Local IP address to the VPN server:

Action	Source	Destination	Service	Redirected To
Redirect to Service	Internet	Any	Any	VPN

c. At the top of the Add Access Rule window, click Add.

Step 2. Verify the Order of the Firewall Rules

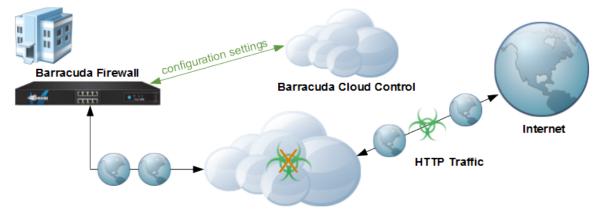

New rules are created at the bottom of the firewall rule set. Because rules are processed from top to bottom in the rule set, arrange your rules in the correct order. You must especially ensure that your rules are placed above the BLOCKALL rule; otherwise, the rules are blocked.

After adjusting the order of rules in the rule set, click Save Changes.

Cloud Features

Barracuda offers two cloud services to centrally manage multiple Barracuda Firewalls and offload processor-intensive tasks:

- Barracuda Cloud Control
- Barracuda Web Security Service

Barracuda Web Security Service

Barracuda Cloud Control

Barracuda Cloud Control is a comprehensive cloud-based service that lets you monitor and configure multiple Barracuda products from a single console. When your Barracuda Firewall is linked to Barracuda Cloud Control, it continuously synchronizes its configuration settings with the service.

For more information on Barracuda Cloud Control, see Barracuda Cloud Control and How to Configure Barracuda Cloud Control.

Barracuda Web Security Service

Barracuda Web Security Service is a cloud-based web filtering and security service. It helps conserve bandwidth by enforcing web policies in the cloud before forwarding traffic to the Barracuda Firewall.

For more information on the Barracuda Web Security Service, see Barracuda Web Security Service and How to Configure the Barracuda Web Security Service.

How to Configure Barracuda Cloud Control

With the Barracuda Cloud Control service, you can centrally configure and manage multiple Barracuda Firewalls. When a Barracuda Firewall is linked to Barracuda Cloud Control, it continuously synchronizes its configuration settings with the service.

To connect a Barracuda Firewall to Barracuda Cloud Control:

- 1. Go to the BASIC > Cloud Control page and verify that your customer account information is already entered.
- Enable Connect to Barracuda Cloud Control and click Save Changes.
 After a successful connection, a "Connected" status appears, indicating that this Barracuda Firewall can be centrally managed using Barracuda Cloud Control.

You do not have to edit any firewall rules.

For more information on Barracuda Cloud Control, see Barracuda Cloud Control.

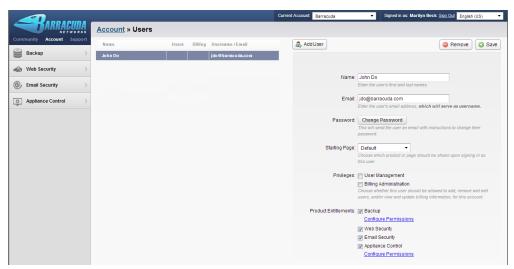

How to Configure the Barracuda Web Security Service

You can configure the Barracuda Firewall to act as a transparent proxy. If you enable the proxy feature, outgoing HTTP traffic is intercepted and redirected to either the Barracuda Web Security Service or to an upstream proxy (the latter option is rarely used).

Before you begin:

The Barracuda Web Security Service requires a paid subscription. To verify that your subscription is active:

- 1. Log into your Barracuda Cloud Control Account.
- 2. Go to the Account > Users page.
- 3. Verify that Product Entitlements: Web Security is selected. If not, contact your reseller or Barracuda Networks representative.

To configure the Barracuda Web Security Service on the Barracuda Firewall:

1. On the NETWORK > Proxy page, select Use Barracuda Web Security Service if connected (recommended).

- 2. To include the user and domain name if available, select the Include User Information check box.
 - For local users, this information is retrieved from the Barracuda DC agent. For information on how to get, install, and configure
 the Barracuda DC Agent, see About the Barracuda DC Agent.
 - For VPN users, the information comes from whatever authentication method is used.
 - To change this selection later, you must disable and then re-enable the Barracuda Web Security Service so that it registers your change.
- 3. To redirect HTTP traffic to the Barracuda Web Security Service, create the required firewall rules.
 - a. Go to the FIREWALL > Firewall Rules page.
 - b. Edit and enable the pre-installed TRANSPARENT-PROXY and TRANSPARENT-PROXY-WIFI (if using Wi-Fi) firewall rules to all ow traffic to pass to the Barracuda Web Security Service.
- 4. Complete the connection from the Barracuda Firewall to the Barracuda Web Security Service.
 - a. Go to the BASIC > Cloud Control page.
 - b. Verify that your customer account information is entered.
 - c. Enable **Connect to Barracuda Cloud Control** and save your changes. After a successful connection, a "Connected" status is displayed.
- 5. Log into your Barracuda Cloud Control account again.
- 6. Click the Web Security tab and refresh the display. Some network activity appears.

Monitoring

The Barracuda Firewall incorporates hardware and software fail-safe mechanisms that are indicated via system alerts and logs. You can inspect the logs to see what is happening with traffic. SNMP monitoring and traps are supported.

These articles describe the tools and monitoring tasks that you can use to track connections and system performance.

In this Section

- Monitoring Active and Recent Connections
- Viewing Logs
- Troubleshooting
- · How to Configure Log Streaming

Monitoring Active and Recent Connections

To monitor network sessions or connections, view the following pages from the BASIC tab:

- Active Connections Lists all of the open and established sessions on the appliance.
- Recent Connections Lists all of the connections that were established on the Barracuda Firewall or that were trying to access the Barracuda Firewall.

You can find the information that you are interested in by filtering the lists. For a description of the displayed fields and information on how to add filters, click **Help** on the product page.

In this article:

- Active Connections
- Recent Connections
- Status Code Overview

Active Connections

The BASIC > Active Connections page lists all of the open and established sessions on the appliance. You can terminate any session by clicking on the red x (\times). If QoS is enabled for a connection, you can manually override the bandwidth policy for the connection by clicking on the arrow next to it and selecting a different policy from the drop-down menu.

In the State column, the following arrows tell you if the connection is established or closing:

Arrow	Status
⇒	One-way traffic.
≑	Connection established (TCP). Two-way traffic (all other).
p	Connection could not be established.
**	Closing connection.

To view the status of a connection, hover over the arrow for a status code. For more information about these status codes, see the Status Code Overview.

Recent Connections

The BASIC > Recent Connections page lists all of the connections that were established on the Barracuda Firewall or that were trying to access the Barracuda Firewall. Use the information on this page for troubleshooting.

In the Action column, the following graphics tell you what action was performed for each connection:

Graphic	Action
A	IPS Rule Applied
	Allowed
×	Terminated
A	Failed
•	Blocked
×	Dropped

To see if there is still incoming or outgoing traffic for a specific session, click **Refresh** and then look at its **Last** or **Count** value.

Sometimes, you might need to view ARP-Update traffic to troubleshoot in more detail. To display ARP-Update info, select the **Include ARPs** chec k box.

To delete the whole history, click Flush Entries.

Status Code Overview

The following table provides more details on the status codes that you might see on the BASIC > Active Connections page.

Status Code	Origin	Description
FWD-NEW	TCP Packet Forwarding Outbound	Session is validated by the firewall rule set, no traffic was forwarded so far.
FWD-FSYN-RCV	TCP Packet Forwarding Outbound	The initial SYN packet received from the session source was forwarded.
FWD-RSYN-RSV	TCP Packet Forwarding Outbound	The session destination answered the SYN with a SYN/ACK packet.
FWD-EST	TCP Packet Forwarding Outbound	The SYN/ACK packet was acknowledge by the session source. The TCP session is established.

FWD-RET	TCP Packet Forwarding Outbound	Either source or destination are retransmitting packets. The connection might
		be dysfunctional.
FWD-FFIN-RCV	TCP Packet Forwarding Outbound	The session source sent a FIN datagram indicating to terminate the session.
FWD-RLACK	TCP Packet Forwarding Outbound	The session destination answered the FIN packet with a FIN reply and awaits the last acknowledgement for this packet.
FWD-RFIN-RCV	TCP Packet Forwarding Outbound	The session destination sent a FIN datagram indicating to terminate the session.
FWD-FLACK	TCP Packet Forwarding Outbound	The session source answered the FIN packet with a FIN reply and awaits the last acknowledgement for this packet.
FWD-WAIT	TCP Packet Forwarding Outbound	The session was reset by one of the two participants by sending a RST packet. A wait period of 5 seconds will silently discard all packet belonging to that session.
FWD-TERM	TCP Packet Forwarding Outbound	The session is terminated and will shortly be removed from the session list.
IFWD-NEW	TCP Packet Forwarding Inbound	Session is validated by the firewall rule set, no traffic was forwarded so.
IFWD-SYN-SND	TCP Packet Forwarding Inbound	A SYN packet was sent to the destination initiating the session (Note that the session with the source is already established).
IFWD-EST	TCP Packet Forwarding Inbound	The destination replied the SYN with a SYN/ACK. The session is established.
IFWD-RET	TCP Packet Forwarding Inbound	Either source or destination are re transmitting packets. The connection might be dysfunctional.
IFWD-FFIN-RCV	TCP Packet Forwarding Inbound	The session source sent a FIN datagram indicating to terminate the session.
IFWD-RLACK	TCP Packet Forwarding Inbound	The session destination answered the FIN packet with a FIN reply and awaits the last acknowledgement for this packet.
IFWD-RFIN-RCV	TCP Packet Forwarding Inbound	The session destination sent a FIN datagram indicating to terminate the session.
IFWD-FLACK	TCP Packet Forwarding Inbound	The session source answered the FIN packet with a FIN reply and awaits the last acknowledgement for this packet.
IFWD-WAIT	TCP Packet Forwarding Inbound	The session was reset by one of the two participants by sending a RST packet. A wait period of 5 seconds will silently discard all packet belonging to that session.
IFWD-TERM	TCP Packet Forwarding Inbound	The session is terminated and will shortly be removed from the session list.
PXY-NEW	TCP Stream Forwarding Outbound	Session is validated by the firewall rule set, no traffic was forwarded so far.

PXY-CONN	TCP Stream Forwarding Outbound	A socket connection to the destination is in progress of being established.
PXY-ACC	TCP Stream Forwarding Outbound	A socket connection to the source is in progress of being accepted.
PXY-EST	TCP Stream Forwarding Outbound	Two established TCP socket connection to the source and destination exist.
PXY-SRC-CLO	TCP Stream Forwarding Outbound	The socket to the source is closed or is in the closing process.
PXY-DST-CLO	TCP Stream Forwarding Outbound	The socket to the destination is closed or is in the closing process.
PXY-SD-CLO	TCP Stream Forwarding Outbound	The source and the destination socket are closed or in the closing process.
PXY-TERM	TCP Stream Forwarding Outbound	The session is terminated and will shortly be removed from the session list.
IPXY-NEW	TCP Stream Forwarding Inbound	Session is validated by the firewall rule set, no traffic was forwarded so far.
IPXY-ACC	TCP Stream Forwarding Inbound	A socket connection to the source is in progress of being accepted.
IPXY-CONN	TCP Stream Forwarding Inbound	A socket connection to the destination is in progress of being established.
IPXY-EST	TCP Stream Forwarding Inbound	Two established TCP socket connection to the source and destination exist.
IPXY-SRC-CLO	TCP Stream Forwarding Inbound	The socket to the source is closed or is in the closing process.
IPXY-DST-CLO	TCP Stream Forwarding Inbound	The socket to the destination is closed or is in the closing process.
IPXY-SD-CLO	TCP Stream Forwarding Inbound	The source and the destination socket are closed or in the closing process
IPXY-TERM	TCP Stream Forwarding Inbound	The session is terminated and will shortly be removed from the session list.
UDP-NEW	UDP Forwarding	Session is validated by the firewall rule set, no traffic was forwarded so far.
UDP-RECV	UDP Forwarding	Traffic has been received from the source and was forwarded to the destination.
UDP-REPL	UDP Forwarding	The destination replied to the traffic sent by the source.
UDP-SENT	UDP Forwarding	The source transmitted further traffic after having received a reply from the destination.
UDP-FAIL	UDP Forwarding	The destination or a network component on the path to the destination sent an ICMP indicating that the request cannot be serviced.
ECHO-NEW	ECHO Forwarding	Session is validated by the firewall rule set, no traffic was forwarded so far.

ECHO-RECV	ECHO Forwarding	Traffic has been received from the source and was forwarded to the destination.
ECHO-REPL	ECHO Forwarding	The destination replied to the traffic sent by the source.
ECHO-SENT	ECHO Forwarding	The source sent more traffic after racing a reply from the destination.
ECHO-FAIL	ECHO Forwarding	The destination or a network component on the path to the destination sent an ICMP indicating that the request cannot be serviced.
OTHER-NEW	OTHER Protocols Forwarding	Session is validated by the firewall rule set. No traffic was forwarded so far.
OTHER-RECV	OTHER Protocols Forwarding	Traffic has been received from the source and was forwarded to the destination.
OTHER-REPL	OTHER Protocols Forwarding	The destination replied to the traffic sent by the source.
OTHER-SENT	OTHER Protocols Forwarding	The source sent more traffic after receiving a reply from the destination.
OTHER-FAIL	OTHER Protocols Forwarding	The destination or a network component on the path to the destination sent an ICMP indicating that the request cannot be serviced.
LOC-NEW	Local TCP Traffic	A local TCP session was granted by the local rule set.
LOC-EST	Local TCP Traffic	The local TCP session is fully established.
LOC-SYN-SND	Local TCP Traffic	A Local-Out TCP session is initiated by sending a SYN packet.
LOC-SYN-RCV	Local TCP Traffic	A Local-In TCP session is initiated by receiving a SYN packet.
LOC-FIN-WAIT1	Local TCP Traffic	An established local TCP session started the close process by sending a FIN packet.
LOC-FIN-WAIT2	Local TCP Traffic	A local TCP session in the FIN-WAIT1 state received an ACK for the FIN packet.
LOC-TIME-WAIT	Local TCP Traffic	A local TCP session in the FIN-WAIT1 or in the FIN-WAIT2 state received a FIN packet.
LOC-CLOSE	Local TCP Traffic	An established local TCP session is closed.
LOC-CLOSE-WAIT	Local TCP Traffic	An established local TCP session received a FIN packet.
LOC-LAST-ACK	Local TCP Traffic	Application holding an established TCP socket responded to a received FIN by closing the socket. A FIN is sent in return.
LOC-LISTEN	Local TCP Traffic	A local socket awaits connection request (SYN packets).
LOC-CLOSING	Local TCP Traffic	A local socket in the FIN_WAIT1 state received a FIN packet.

LOC-FINISH	Local TCP Traffic	A local TCP socket was removed from the internal socket list.

Viewing Logs

From the LOGS tab, there are a number of log files that you can view to monitor and troubleshoot the Barracuda Firewall:

- Firewall Log
- HTTP Log
- Network Log
- VPN Log
- Service Log
- Authentication Log
- HTTP Log Codes Overview

For all of these logs, click Help for a description of the information on the page.

Firewall Log

The Firewall Log displays firewall activity such as rules that have been executed and traffic that has been dropped. It lists all connections on the Barracuda Firewall. You can filter the log by criteria such as a source IP address or network, or the time that the connections occurred.

HTTP Log

The HTTP Log displays the activities of the Barracuda Firewall's HTTP proxy. There are several codes in the log. For details on these codes, see the HTTP Log Codes Overview.

Network Log

Use the Network Log to investigate why network configuration changes are not working properly or cannot be activated.

The messages in the Network Log might explain the problem. If not, check the network configuration again for any problems or conflicts.

VPN Log

The VPN Log displays information for all client-to-site and site-to-site VPN tunnels. Use this log to investigate why VPN tunnels and PPTP connections are disconnecting or not being established.

To see the messages for specific VPN connections, you can also filter the log by IP addresses.

Service Log

The Service Log lists specific errors and warnings for services that are not configured properly or are encountering problems. To restart these services and debug any problems, you might need to contact Barracuda Networks Technical Support for assistance.

Authentication Log

The Authentication Log displays messages from the authentication service. This includes logins for the web interface and messages from the various authentication methods.

For example, if a client is not able to access a service, the unsuccessful authentications are written into the log. Successful authentications are also recorded.

HTTP Log Codes Overview

The following tables provide details on the codes that you might see on the LOGS > HTTP Log page.

TCP Codes | ERR Codes

TCP Codes

Code	Description
TCP_HIT	A valid copy of the requested object was in the cache.
TCP_MISS	The requested object was not in the cache.
TCP_REFRESH_HIT	An expired copy of the requested object was in the cache. Squid made an If-Modified-Since request and the response was "Not Modified."
TCP_REFRESH_FAIL_HIT	An expired copy of the requested object was in the cache. Squid attempted to make an If-Modified-Since request, but it failed. The old (stale) object was delivered to the client.
TCP_REFRESH_MISS	An expired copy of the requested object was in the cache. Squid made an If-Modified-Since request and received a new object.
TCP_CLIENT_REFRESH	The client issued a request with the "no-cache" pragma. ("reload" - handled as MISS)
TCP_IMS_HIT	An If-Modified-Since GET request was received from the client. A valid copy of the object was in the cache (fresh).
TCP_IMS_MISS	An If-Modified-Since GET request was received from the client. The requested object was not in the cache (stale).
TCP_SWAPFAIL	The object was believed to be in the cache, but could not be accessed.
TCP_DENIED	Access was denied for this request.

ERR Codes

Error	Description
ERR_READ_TIMEOUT	The remote site or network is unreachable; it may be down.
ERR_LIFETIME_EXP	The remote site or network may be too slow or down.
ERR_NO_CLIENTS_BIG_OBJ	All clients went away before transmission completed and the object is too big to cache.
ERR_READ_ERROR	The remote site or network may be down.
ERR_CLIENT_ABORT	Client dropped connection before transmission completed. Squid fetches the Object according to its settings for `quick_abort'.
ERR_CONNECT_FAIL	The remote site or server may be down.
ERR_INVALID_REQ	Invalid HTTP request.
ERR_UNSUP_REQ	Unsupported request.

ERR_CANNOT_FETCH	The requested URL cannot currently be retrieved.
ERR_NO_RELAY	There is no WAIS relay host defined for this cache.

ERR_DISK_IO	The system disk is out of space or failing.
ERR_ZERO_SIZE_OBJECT	The remote server closed the connection before sending any data.
ERR_FTP_DISABLED	This cache is not configured to retrieve FTP objects.
ERR_PROXY_DENIED	Access denied. Users must be authenticated before accessing this cache.

Troubleshooting

The following diagnostic tools should help you troubleshoot most problems. Please read this article before contacting Barracuda Networks Technical Support.

In this article:

- Basic Troubleshooting Tools
- Connect to Barracuda Support Servers
- Rebooting the System in Recovery Mode
- Reboot Options
- Barracuda Instant Replacement Service

Basic Troubleshooting Tools

The **ADVANCED > Troubleshooting** page provides a suite of tools to help you troubleshoot network connectivity issues that might be impacting the performance of your Barracuda Firewall.

For example, you can test your Barracuda Firewall's connection to the Barracuda Networks update servers to verify that it can successfully download the latest Energize Update definitions. You can also ping or telnet to other devices from the Barracuda Firewall, perform dig/NS-lookup, TCP dump, and perform a trace route from the Barracuda Firewall to any another system.

Connect to Barracuda Support Servers

To let technical support engineers troubleshoot your system, you can initiate a connection between your Barracuda Firewall and the Barracuda Networks Technical Support Center. On the ADVANCED > Troubleshooting page, in the Support Connection section, click Establish Connection to Barracuda Support Center.

Rebooting the System in Recovery Mode

If your Barracuda Firewall experiences a serious issue that impacts its core functionality, you can use diagnostic and recovery tools that are available from the reboot menu to return your system to an operational state. Before you use the diagnostic and recovery tools:

- Use the built-in troubleshooting tools on the ADVANCED > Troubleshooting page to help diagnose the problem.
- Perform a system restore from the last known good backup file.
- Contact Barracuda Networks Technical Support for additional troubleshooting tips.

As a last resort, you can reboot your Barracuda Firewall and run a memory test or perform a complete system recovery, as described below.

To perform a system recovery or hardware test:

- 1. Connect a monitor and keyboard directly to your Barracuda Firewall.
- 2. Reboot the system by doing one of the following:
 - In the web interface: Go to the BASIC > Administration page, navigate to the System Reload/Shutdown section, and click Restart.
 - At the front panel of the Barracuda Firewall: Press the **Power** button on the front panel to turn off the system, and then press the **Power** button again to turn the system on.

The splash screen displays with the following three boot options:

Barracuda

Recovery

Hardware Test

3. Use your keyboard to select a boot option, and then press the **Enter** key. You must select the boot option within three seconds after the splash screen appears. If you do not select an option within three seconds, the Barracuda Firewall starts up in **Normal** mode (first option). For a description of each boot option, refer to the **Reboot Options** below.

To stop a hardware test, reboot your Barracuda Firewall by pressing Ctrl+Alt+Del.

Reboot Options

The table below describes the options available at the reboot menu.

Reboot Options	Description
Barracuda	Starts the Barracuda Firewall in the normal (default) mode. This option is automatically selected if no other option is specified within the first three seconds of the splash screen appearing.
Recovery	Displays the Recovery Console, where you can select the following options: Barracuda Repair (no data loss) – Repairs the file system on the Barracuda Firewall. Full Barracuda Recovery (all data lost) – Restores the factory settings on your Barracuda Firewall and clears out the configuration information. Enable remote administration (reverse runnel) – Turns on the reverse tunnel that lets Barracuda Networks Technical Support access the system. You can also enable remote administration by going to the ADVANCED >Troubleshooting page and clicking Establish Connection to Barracuda Support Center. Diagnostic memory test – Runs a diagnostic memory test from the operating system. If problems are reported when running this option, we recommend running the Hardware_Test option next.
Hardware_Test	Performs a thorough memory test that shows most memory-related errors within a two-hour time period. The memory test is performed outside of the operating system and can take a long time to complete. To stop the hardware test, reboot your Barracuda Firewall.

Replacing a Failed System

Before you replace your Barracuda Firewall, use the tools provided on the **ADVANCED > Troubleshooting** page to try to resolve the problem, or call Barracuda Networks Technical Support.

Barracuda Instant Replacement Service

If you purchased the Instant Replacement service and the Barracuda Firewall fails, you can call Barracuda Networks Technical Support and arrange for a new unit to be shipped out within 24 hours.

After receiving the new system, ship the old Barracuda Firewall back to Barracuda Networks at the address below, with an RMA number marked clearly on the package. Barracuda Networks Technical Support can provide details on the best way to return the unit.

Barracuda Networks 3175 S. Winchester Blvd Campbell, CA 95008

To set up the new Barracuda Firewall so that it has the same configuration as your old failed system, first manually configure the new system's IP information on the BASIC > IP Configuration page, and then restore the backup file from the old system onto the new system. For information on restoring data, see How to Save Configuration Backups and How to Restore the Barracuda Firewall with a Saved Configuration Backup.

How to Configure Log Streaming

Version Info

This feature is available for the Barracuda Firewall version 6.1.0 and above.

With the Barracuda Firewall, you can choose to stream the following logs to a syslog server:

- Firewall Log
- HTTP Log
- Network Log
- VPN Log
- · Service Log
- Authentication Log

Configure Syslog Streaming

Before you begin:

· Verify that the syslog server supports the protocol that you want to use. All syslog servers support UDP, but not all support TCP.

To configure log streaming:

- 1. Go to the LOGS > Log Streaming page.
- 2. In the Stream target field, type the hostname or IP address of your syslog server. You can define only one target.
- 3. Select the Protocol and Port. The default port for UDP is 514. If you select TCP, you must choose a different port.
- 4. Choose which log streams to enable.
- 5. Click Save Changes.

To verify that the connection to the syslog server can be established, go to the BASIC > Recent Connections page. Filter the list of connections for the Protocol, Service, and Destination IP of the syslog server.

Maintenance

In this Section

- How to Save Configuration Backups
- How to Update the Firmware on Your Barracuda Firewall
- How to Restore the Barracuda Firewall with a Saved Configuration Backup
- How to Recover the Barracuda Firewall

How to Save Configuration Backups

Barracuda Networks recommends that you regularly back up the latest working configuration, in case you need to restore this information on a replacement Barracuda Firewall or the current system data becomes corrupt. It is also very important to back up your configuration before updating your Barracuda Firewall to the latest available firmware.

You can back up your current Barracuda Firewall configuration into a single file. After a misconfiguration or hardware failure, you can import this backup file (*.bak) to the Barracuda Firewall to restore the saved configuration. You have two options for saving configuration backups:

- For manual backups, on the local file system of a computer that manages the Barracuda Firewall.
- · For automated backups, remotely on an FTP server as well as on a Windows network share (SMB).

The following information is not included in the backup file:

- System password
- · System management IP address
- DNS information

Manual Backups

To manually save a configuration backup of a Barracuda Firewall and store it locally:

- 1. Go to the **ADVANCED > Backups** page.
- In the Configuration Backup section, select the System Configuration check box and click Backups. Your web browser offers a file that contains the current configuration of your Barracuda Firewall for download.
- 3. Choose a destination on your local file system and accept the download.

Automated Backups

To automatically back up your configurations and store them on either an FTP server or a Windows network share:

- 1. Go to the ADVANCED > Backups page.
- 2. In the Automated Backups section, select either FTP or SMB (Windows Shared) from the Server Type list.
- 3. Enter the settings for the server on which the backup file will be stored.
- 4. To test the connection to the server, click Test Backup Server.
- 5. Configure and schedule the automated backups.
- 6. Click Save Changes.

For information on how to restore a saved configuration backup, see How to Restore the Barracuda Firewall with a Saved Configuration Backup.

How to Update the Firmware on Your Barracuda Firewall

Before you begin:

Ensure that you back up your current Barracuda Firewall configuration. For more information, see How to Save Configuration Backups.

To manually update the firmware version of the Barracuda Firewall:

- 1. Go to the ADVANCED > Firmware Update page.
- If you have the latest firmware version already installed, you can click **Download Now**.
 Applying the update might take several minutes to complete. The Barracuda Firewall automatically reboots after the update is applied.

How to Restore the Barracuda Firewall with a Saved Configuration Backup

To back up and restore the configuration of your Barracuda Firewall, go to the **ADVANCED > Backups** page. You can restore your Barracuda Firewall from either locally saved backups or backups stored on a remote server.

Regularly back up your appliance, in case you need to restore this information on a replacement Barracuda Firewall or the current system data becomes corrupt. For more information about backing up and restoring your appliance, click **Help** on the page.

The following information is not included in the backup file:

- System password: After the appliance is restored, the password is reset to the default password (admin).
- DNS information

How to Recover the Barracuda Firewall

To recover the Barracuda Firewall, you can use the Recovery Console with one of the following recovery options:

- Barracuda Repair Retains your settings and data during system recovery.
- Full Barracuda Repair Reinstalls the Barracuda Firewall with factory default settings. With this option, all your settings and data will be lost. If you are unsure of which recovery option to use, first run the Barracuda Repair. If problems persist, run a Full Barracuda Repair.

①

Do not manually reboot your system at any time during recovery or repair, unless otherwise instructed by Barracuda Networks

Technical Support. Depending on your current firmware version and other system factors, this process can take up to 15 minutes. If it takes longer, please contact Barracuda Networks Technical Support for further assistance.

In this article

- · Before You Begin
- Recover the Barracuda Firewall

Before You Begin

Before you recover the Barracuda Firewall, ensure that you have physical access to the system. You must also have the following equipment:

- Monitor with a VGA cable
- USB keyboard

Recover the Barracuda Firewall

To recover the Barracuda Firewall:

- 1. Ensure that the Barracuda Firewall is turned off and the ports in the back of the appliance are accessible.
- 2. Connect the monitor to the VGA port.
- 3. Connect the keyboard to one of the USB ports.
- 4. Turn on the Barracuda Firewall by plugging the power cord in.
- 5. When the bootloader menu displays, use your keyboard to select **Recovery**. After two to three minutes, the system boots into the Recovery Console menu:

Recovery Console

BARRACUDA NETWORKS RECOVERY CONSOLE

Please make a selection

(1) Barracuda Repair (no data loss)

(2) Full Barracuda Recovery (all data lost)

(3) Enable remote administration (reverse tunnel)

(5) EXIT

- 6. Select a recovery option:
 - If you want to retain all of your data and settings during the repair, enter 1 to select the **Barracuda Repair (no data loss)** option.
 - If you want to restore the Barracuda Firewall with the default factory settings, enter 2 to select the Full Barracuda Recovery (all data lost) option. With this option, you will lose all of your current data and settings. When you are prompted by the on-screen instructions, confirm that you want to continue with the recovery.
- 7. After you receive the message stating that the recovery process is complete, enter 5 to exit the Recovery Console. The Barracuda Firewall then reboots.

If problems persist after the reboot, please contact Barracuda Networks Technical Support for further assistance.

Hardware Compliance

This section contains compliance information for the appliance.

Notice for the USA

Compliance Information Statement (Declaration of Conformity Procedure) DoC FCC Part 15: This device complies with part 15 of the FCC Rules.

Operation is subject to the following conditions:

- 1. This device may not cause harmful interference, and
- 2. This device must accept any interference received including interference that may cause undesired operation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user in encouraged to try one or more of the following measures:
- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Plug the equipment into an outlet on a circuit different from that of the receiver.
- Consult the dealer on an experienced radio/ television technician for help.

Notice for Canada

This apparatus complies with the Class B limits for radio interference as specified in the Canadian Department of Communication Radio Interference Regulations.

Notice for Europe (CE Mark)

This product is in conformity with the Council Directive 89/336/EEC, 92/31/EEC (EMC).

Power Requirements

AC input voltage 100-240 volts; frequency 50/60 Hz.

Limited Warranty and License

Limited Warranty

Barracuda Networks, Inc., or the Barracuda Networks, Inc. subsidiary or authorized Distributor selling the Barracuda Networks product, if sale is not directly by Barracuda Networks, Inc., ("Barracuda Networks") warrants that commencing from the date of delivery to Customer (but in case of resale by a Barracuda Networks reseller, commencing not more than sixty (60) days after original shipment by Barracuda Networks, Inc.), and continuing for a period of one (1) year: (a) its products (excluding any software) will be free from material defects in materials and workmanship under normal use; and (b) the software provided in connection with its products, including any software contained or embedded in such products will substantially conform to Barracuda Networks published specifications in effect as of the date of manufacture. Except for the foregoing, the software is provided as is. In no event does Barracuda Networks warrant that the software is error free or that Customer will be able to operate the software without problems or interruptions. In addition, due to the continual development of new techniques for intruding upon and attacking networks, Barracuda Networks does not warrant that the software or any equipment, system or network on which the software is used will be free of vulnerability to intrusion or attack. The limited warranty extends only to you the original buyer of the Barracuda Networks product and is non-transferable.

Exclusive Remedy

Your sole and exclusive remedy and the entire liability of Barracuda Networks under this limited warranty shall be, at Barracuda Networks or its service centers option and expense, the repair, replacement or refund of the purchase price of any products sold which do not comply with this warranty. Hardware replaced under the terms of this limited warranty may be refurbished or new equipment substituted at Barracuda Networks option. Barracuda Networks obligations hereunder are conditioned upon the return of affected articles in accordance with Barracuda Networks then-current Return Material Authorization ("RMA") procedures. All parts will be new or refurbished, at Barracuda Networks discretion, and shall be furnished on an exchange basis. All parts removed for replacement will become the property of the Barracuda Networks. In connection with warranty services hereunder, Barracuda Networks may at its discretion modify the hardware of the product at no cost to you to improve its reliability or performance. The warranty period is not extended if Barracuda Networks repairs or replaces a warranted product or any parts. Barracuda Networks may change the availability of limited warranties, at its discretion, but any changes will not be retroactive. IN NO EVENT SHALL BARRACUDA NETWORKS LIABILITY EXCEED THE PRICE PAID FOR THE PRODUCT FROM DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES RESULTING FROM THE USE OF THE PRODUCT, ITS ACCOMPANYING SOFTWARE, OR ITS DOCUMENTATION.

Exclusions and Restrictions

This limited warranty does not apply to Barracuda Networks products that are or have been (a) marked or identified as "sample" or "beta," (b) loaned or provided to you at no cost, (c) sold "as is," (d) repaired, altered or modified except by Barracuda Networks, (e) not installed, operated or maintained in accordance with instructions supplied by Barracuda Networks, or (f) subjected to abnormal physical or electrical stress, misuse, negligence or to an accident.

EXCEPT FOR THE ABOVE WARRANTY, BARRACUDA NETWORKS MAKES NO OTHER WARRANTY, EXPRESS, IMPLIED OR STATUTORY, WITH RESPECT TO BARRACUDA NETWORKS PRODUCTS, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTY OF TITLE, AVAILABILITY, RELIABILITY, USEFULNESS, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NONINFRINGEMENT, OR ARISING FROM COURSE OF PERFORMANCE, DEALING, USAGE OR TRADE. EXCEPT FOR THE ABOVE WARRANTY, BARRACUDA NETWORKS PRODUCTS AND THE SOFTWARE IS PROVIDED "AS IS" AND BARRACUDA NETWORKS DOES NOT WARRANT THAT ITS PRODUCTS WILL MEET YOUR REQUIREMENTS OR BE UNINTERRUPTED, TIMELY, AVAILABLE, SECURE OR ERROR-FREE, OR THAT ANY ERRORS IN ITS PRODUCTS OR THE SOFTWARE WILL BE CORRECTED. FURTHERMORE, BARRACUDA NETWORKS DOES NOT WARRANT THAT BARRACUDA NETWORKS PRODUCTS, THE SOFTWARE OR ANY EQUIPMENT, SYSTEM OR NETWORK ON WHICH BARRACUDA NETWORKS PRODUCTS WILL BE USED WILL BE FREE OF VULNERABILITY TO INTRUSION OR ATTACK.

Software License

PLEASE READ THIS SOFTWARE LICENSE AGREEMENT ("AGREEMENT") CAREFULLY BEFORE USING THE BARRACUDA SOFTWARE. BY USING THE BARRACUDA SOFTWARE YOU ARE AGREEING TO BE BOUND BY THE TERMS OF THIS LICENSE. IF YOU DO NOT AGREE TO THE TERMS OF THIS LICENSE DO NOT USE THE SOFTWARE. IF YOU DO NOT AGREE TO THE TERMS OF THIS LICENSE YOU MAY RETURN THE SOFTWARE OR HARDWARE CONTAINING THE SOFTWARE FOR A FULL REFUND TO YOUR PLACE OF PURCHASE.

1. The software, documentation, whether on disk, in read only memory, or on any other media or in any other form (collectively "Barracuda Software") is licensed, not sold, to you by Barracuda Networks, Inc. ("Barracuda") for use only under the terms of this License and Barracuda

reserves all rights not expressly granted to you. The rights granted are limited to Barracuda's intellectual property rights in the Barracuda Software and do not include any other patent or intellectual property rights. You own the media on which the Barracuda Software is recorded but Barracuda retains ownership of the Barracuda Software itself.

- 2. Permitted License Uses and Restrictions. This License allows you to use the Software only on the single Barracuda labeled hardware device on which the software was delivered. You may not make copies of the Software and you may not make the Software available over a network where it could be utilized by multiple devices or copied. You may not make a backup copy of the Software. You may not modify or create derivative works of the Software except as provided by the Open Source Licenses included below. The BARRACUDA SOFTWARE IS NOT INTENDED FOR USE IN THE OPERATION OF NUCLEAR FACILITIES, AIRCRAFT NAVIGATION OR COMMUNICATION SYSTEMS, LIFE SUPPORT MACHINES, OR OTHER EQUIPEMENT IN WHICH FAILURE COULD LEAD TO DEATH, PERSONAL INJURY, OR ENVIRONMENTAL DAMAGE.
- 3. You may not transfer, rent, lease, lend, or sublicense the Barracuda Software.
- 4. This License is effective until terminated. This License is automatically terminated without notice if you fail to comply with any term of the License. Upon termination you must destroy or return all copies of the Barracuda Software.
- 5. YOU EXPRESSLY ACKNOWLEDGE AND AGREE THAT THE USE OF THE BARRACUDA SOFTWARE IS AT YOUR OWN RISK AND THAT THE ENTIRE RISK AS TO SATISFACTION, QUALITY, PERFORMANCE, AND ACCURACY IS WITH YOU. THE BARRACUDA SOFTWARE IS PROVIDED "AS IS" WITH ALL FAULTS AND WITHOUT WARRANTY OF ANY KIND, AND BARRACUDA HEREBY DISCLAIMS ALL WARRANTIES AND CONDITIONS WITH RESPECT TO THE BARRACUDA SOFTWARE, EITHER EXPRESSED OR IMPLIED OR STATUTORY, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES AND/OR CONDITIONS OF MERCHANTIBILITY, OF SATISFACTORY QUALITY, OF FITNESS FOR ANY APPLICATION, OF ACCURACY, AND OF NON-INFRINGEMENT OF THIRD PARTY RIGHTS. BARRACUDA DOES NOT WARRANT THE CONTINUED OPERATION OF THE SOFTWARE, THAT THE PERFORMANCE WILL MEET YOUR EXPECTATIONS, THAT THE FUNCTIONS WILL MEET YOUR REQUIREMENTS, THAT THE OPERATION WILL BE ERROR FREE OR CONTINUOUS, OR THAT DEFECTS WILL BE CORRECTED. NO ORAL OR WRITTEN INFORMATION GIVEN BY BARRACUDA OR AUTHORIZED BARRACUDA REPRESENTATIVE SHALL CREATE A WARRANTY. SHOULD THE BARRACUDA SOFTWARE PROVE DEFECTIVE, YOU ASSUME THE ENTIRE COST OF ALL NECESSARY SERVICING, REPAIR, OR CORRECTION.
- 6. License. YOU EXPRESSLY ACKNOWLEDGE AND AGREE THAT YOU WILL PROVIDE AN UNLIMITED ZERO COST LICENSE TO BARRACUDA FOR ANY PATENTS OR OTHER INTELLECTUAL PROPERTY RIGHTS UTILIZED IN THE BARRACUDA SOFTWARE WHICH YOU EITHER OWN OR CONTROL.
- 7. Limitation of Liability. TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT SHALL BARRACUDA BE LIABLE FOR PERSONAL INJURY OR ANY INCIDENTAL SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES WHATSOEVER, INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF PROFITS, LOSS OF DATA, BUSINESS INTERRUPTION, OR ANY OTHER COMMERCIAL DAMAGES OR LOSSES, ARISING OUT OF OR RELATED TO YOUR ABILITY TO USE OR INABILITY TO USE THE BARRACUDA SOFTWARE HOWEVER CAUSED, REGARDLESS OF THE THEORY OF LIABILITY AND EVEN IF BARRACUDA HAS BEEN ADVISED OF THE POSSIBILITY OF DAMAGES. In no event shall Barracuda's total liability to you for all damages exceed the amount of one hundred dollars.
- 8. Export Control. You may not use or otherwise export or re-export Barracuda Software except as authorized by the United States law and the laws of the jurisdiction where the Barracuda Software was obtained.

Energize Update Software License

PLEASE READ THIS ENERGIZE UPDATE SOFTWARE LICENSE CAREFULLY BEFORE DOWNLOADING, INSTALLING OR USING BARRACUDA NETWORKS OR BARRACUDA NETWORKS-SUPPLIED ENERGIZE UPDATE SOFTWARE.

BY DOWNLOADING OR INSTALLING THE ENERGIZE UPDATE SOFTWARE, OR USING THE EQUIPMENT THAT CONTAINS THIS SOFTWARE, YOU ARE CONSENTING TO BE BOUND BY THIS LICENSE. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS LICENSE, THEN (A) DO NOT DOWNLOAD, INSTALL OR USE THE SOFTWARE, AND (B) YOU MAY RETURN THE SOFTWARE FOR A FULL REFUND, OR, IF THE SOFTWARE IS SUPPLIED AS PART OF ANOTHER PRODUCT, YOU MAY RETURN THE ENTIRE PRODUCT FOR A FULL REFUND. YOUR RIGHT TO RETURN AND REFUND EXPIRES 30 DAYS AFTER PURCHASE FROM BARRACUDA NETWORKS OR AN AUTHORIZED BARRACUDA NETWORKS RESELLER, AND APPLIES ONLY IF YOU ARE THE ORIGINAL PURCHASER.

The following terms govern your use of the Energize Update Software except to the extent a particular program (a) is the subject of a separate written agreement with Barracuda Networks or (b) includes a separate "click-on" license agreement as part of the installation and/or download process. To the extent of a conflict between the provisions of the foregoing documents, the order of precedence shall be (1) the written agreement, (2) the click-on agreement, and (3) this Energize Update Software License.

License. Subject to the terms and conditions of and except as otherwise provided in this Agreement, Barracuda Networks, Inc., or a Barracuda Networks, Inc. subsidiary (collectively "Barracuda Networks"), grants to the end-user ("Customer") a nonexclusive and nontransferable license to use the Barracuda Networks Energize Update program modules and data files for which Customer has paid the required license fees (the "Energize Update Software"). In addition, the foregoing license shall also be subject to the following limitations, as applicable:

Unless otherwise expressly provided in the documentation, Customer shall use the Energize Update Software solely as embedded in, for execution on, or (where the applicable documentation permits installation on non-Barracuda Networks equipment) for communication with Barracuda Networks equipment owned or leased by Customer; Customer's use of the Energize Update Software shall be limited to use on a single hardware chassis, on a single central processing unit, as applicable, or use on such greater number of chassis or central processing units as Customer may have paid Barracuda Networks the required license fee; and Customer's use of the Energize Update Software shall also be limited, as applicable and set forth in Customer's purchase order or in Barracuda Networks' product catalog, user documentation, or web site, to a maximum number of (a) seats (i.e. users with access to the installed Energize Update Software), (b) concurrent users, sessions, ports, and/or issued and outstanding IP addresses, and/or (c) central processing unit cycles or instructions per second. Customer's use of the Energize Update Software shall also be limited by any other restrictions set forth in Customer's purchase order or in Barracuda Networks' product catalog, user documentation or web site for the Energize Update Software.

General Limitations. Except as otherwise expressly provided under this Agreement, Customer shall have no right, and Customer specifically agrees not to:

- i. transfer, assign or sublicense its license rights to any other person, or use the Energize Update Software on unauthorized or secondhand Barracuda Networks equipment, and any such attempted transfer, assignment or sublicense shall be void;
- ii. make error corrections to or otherwise modify or adapt the Energize Update Software or create derivative works based upon the Energize Update Software, or to permit third parties to do the same; or
- iii. decompile, decrypt, reverse engineer, disassemble or otherwise reduce the Energize Update Software to human-readable form to gain access to trade secrets or confidential information in the Energize Update Software.

Upgrades and Additional Copies. For purposes of this Agreement, "Energize Update Software" shall include (and the terms and conditions of this Agreement shall apply to) any Energize Update upgrades, updates, bug fixes or modified versions (collectively, "Upgrades") or backup copies of the Energize Update Software licensed or provided to Customer by Barracuda Networks or an authorized distributor/reseller for which Customer has paid the applicable license fees. NOTWITHSTANDING ANY OTHER PROVISION OF THIS AGREEMENT: (1) CUSTOMER HAS NO LICENSE OR RIGHT TO USE ANY SUCH ADDITIONAL COPIES OR UPGRADES UNLESS CUSTOMER, AT THE TIME OF ACQUIRING SUCH COPY OR UPGRADE, ALREADY HOLDS A VALID LICENSE TO THE ORIGINAL ENERGIZE UPDATE SOFTWARE AND HAS PAID THE APPLICABLE FEE FOR THE UPGRADE; (2) USE OF UPGRADES IS LIMITED TO BARRACUDA NETWORKS EQUIPMENT FOR WHICH CUSTOMER IS THE ORIGINAL END USER PURCHASER OR LESSEE OR WHO OTHERWISE HOLDS A VALID LICENSE TO USE THE ENERGIZE UPDATE SOFTWARE WHICH IS BEING UPGRADED; AND (3) USE OF ADDITIONAL COPIES IS LIMITED TO BACKUP PURPOSES ONLY.

Energize Update Changes. Barracuda Networks reserves the right at any time not to release or to discontinue release of any Energize Update Software and to alter prices, features, specifications, capabilities, functions, licensing terms, release dates, general availability or other characteristics of any future releases of the Energize Update Software.

Proprietary Notices. Customer agrees to maintain and reproduce all copyright and other proprietary notices on all copies, in any form, of the Energize Update Software in the same form and manner that such copyright and other proprietary notices are included on the Energize Update Software. Except as expressly authorized in this Agreement, Customer shall not make any copies or duplicates of any Energize Update Software without the prior written permission of Barracuda Networks. Customer may make such backup copies of the Energize Update Software as may be necessary for Customer's lawful use, provided Customer affixes to such copies all copyright, confidentiality, and proprietary notices that appear on the original.

Protection of Information. Customer agrees that aspects of the Energize Update Software and associated documentation, including the specific design and structure of individual programs, constitute trade secrets and/or copyrighted material of Barracuda Networks. Customer shall not disclose, provide, or otherwise make available such trade secrets or copyrighted material in any form to any third party without the prior written consent of Barracuda Networks. Customer shall implement reasonable security measures to protect and maintain the confidentiality of such trade secrets and copyrighted material. Title to Energize Update Software and documentation shall remain solely with Barracuda Networks.

Indemnity. Customer agrees to indemnify, hold harmless and defend Barracuda Networks and its affiliates, subsidiaries, officers, directors, employees and agents at Customers expense, against any and all third-party claims, actions, proceedings, and suits and all related liabilities, damages, settlements, penalties, fines, costs and expenses (including, without limitation, reasonable attorneys fees and other dispute resolution expenses) incurred by Barracuda Networks arising out of or relating to Customers (a) violation or breach of any term of this Agreement or any policy or guidelines referenced herein, or (b) use or misuse of the Barracuda Networks Energize Update Software.

Term and Termination. This License is effective upon date of delivery to Customer of the initial Energize Update Software (but in case of resale by a Barracuda Networks distributor or reseller, commencing not more than sixty (60) days after original Energize Update Software purchase from Barracuda Networks) and continues for the period for which Customer has paid the required license fees. Customer may terminate this License at any time by notifying Barracuda Networks and ceasing all use of the Energize Update Software. By terminating this License, Customer forfeits any refund of license fees paid and is responsible for paying any and all outstanding invoices. Customer's rights under this License will terminate immediately without notice from Barracuda Networks if Customer fails to comply with any provision of this License. Upon termination, Customer must cease use of all copies of Energize Update Software in its possession or control.

Export. Software, including technical data, may be subject to U.S. export control laws, including the U.S. Export Administration Act and its associated regulations, and may be subject to export or import regulations in other countries. Customer agrees to comply strictly with all such regulations and acknowledges that it has the responsibility to obtain licenses to export, re-export, or import Energize Update Software.

Restricted Rights. Barracuda Networks' commercial software and commercial computer software documentation is provided to United States Government agencies in accordance with the terms of this Agreement, and per subparagraph "(c)" of the "Commercial Computer Software - Restricted Rights" clause at FAR 52.227-19 (June 1987). For DOD agencies, the restrictions set forth in the "Technical Data-Commercial Items" clause at DFARS 252.227-7015 (Nov 1995) shall also apply.

No Warranty. The Energize Update Software is provided AS IS. Customer's sole and exclusive remedy and the entire liability of Barracuda Networks under this Energize Update Software License Agreement will be, at Barracuda Networks option, repair, replacement, or refund of the Energize Update Software.

Renewal. At the end of the Energize Update Service Period, Customer may have the option to renew the Energize Update Service at the current list price, provided such Energize Update Service is available. All initial subscriptions commence at the time of sale of the unit and all renewals commence at the expiration of the previous valid subscription.

In no event does Barracuda Networks warrant that the Energize Update Software is error free or that Customer will be able to operate the Energize Update Software without problems or interruptions. In addition, due to the continual development of new techniques for intruding upon and attacking networks, Barracuda Networks does not warrant that the Energize Update Software or any equipment, system or network on which the Energize Update Software is used will be free of vulnerability to intrusion or attack.

DISCLAIMER OF WARRANTY. ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS, AND WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OR CONDITION OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NONINFRINGEMENT, SATISFACTORY QUALITY OR ARISING FROM A COURSE OF DEALING, LAW, USAGE, OR TRADE PRACTICE, ARE HEREBY EXCLUDED TO THE EXTENT ALLOWED BY APPLICABLE LAW. TO THE EXTENT AN IMPLIED WARRANTY CANNOT BE EXCLUDED, SUCH WARRANTY IS LIMITED IN DURATION TO THE WARRANTY PERIOD. BECAUSE SOME STATES OR JURISDICTIONS DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS, THE ABOVE LIMITATION MAY NOT APPLY TO YOU. THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS, AND YOU MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM JURISDICTION TO JURISDICTION.

General Terms Applicable to the Energize Update Software License Disclaimer of Liabilities. IN NO EVENT WILL BARRACUDA NETWORKS BE LIABLE FOR ANY LOST REVENUE, PROFIT, OR DATA, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL, OR PUNITIVE DAMAGES HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY ARISING OUT OF THE USE OF OR INABILITY TO USE THE ENERGIZE UPDATE SOFTWARE EVEN IF BARRACUDA NETWORKS OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. In no event shall Barracuda Networks' liability to Customer, whether in contract, tort (including negligence), or otherwise, exceed the price paid by Customer. BECAUSE SOME STATES OR JURISDICTIONS DO NOT ALLOW LIMITATION OR EXCLUSION OF CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

This Energize Update Software License shall be governed by and construed in accordance with the laws of the State of California, without reference to principles of conflict of laws, provided that for Customers located in a member state of the European Union, Norway or Switzerland, English law shall apply. The United Nations Convention on the International Sale of Goods shall not apply. If any portion hereof is found to be void or unenforceable, the remaining provisions of the Energize Update Software License shall remain in full force and effect. Except as expressly provided herein, the Energize Update Software License constitutes the entire agreement between the parties with respect to the license of the Energize Update Software and supersedes any conflicting or additional terms contained in the purchase order.

Open Source Licensing

Barracuda products may include programs that are covered by the GNU General Public License (GPL) or other "open source" license agreements. The GNU license is re-printed below for you reference. These programs are copyrighted by their authors or other parties, and the authors and copyright holders disclaim any warranty for such programs. Other programs are copyright by Barracuda Networks.

GNU GENERAL PUBLIC LICENSE, (GPL) Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc. 51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public

License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whethergratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

- 2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
 - a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
 - b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
 - c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

- 3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:
 - a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
 - b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
 - c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

- 4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.
- 5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.
- 6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.
- 7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

- 8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
- 9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software

Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

- 11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.
- 12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

one line to give the program's name and an idea of what it does.

Copyright (C) yyyy name of author

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place - Suite 330, Boston, MA 02111-1307, USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) 19yy name of author Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'. This is free software, and you are welcome to redistribute it under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than `show w' and `show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.

signature of Ty Coon, 1 April 1989 Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General

Public License instead of this License.

Barracuda Products may contain programs that are copyright (c)1995-2005 International Business Machines Corporation and others. All rights reserved. These programs are covered by the following License:

"Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, provided that the above copyright notice(s) and this permission notice appear in all copies of the Software and that both the above copyright notice(s) and this permission notice appear in supporting documentation."

Barracuda Products may include programs that are covered by the BSD License: "Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

The names of the authors may not be used to endorse or promote products derived from this software without specific prior written permission.

Apache License Version 2.0, January 2004 http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

- 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
- 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
- 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
- (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
- (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
- (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
- (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License.

You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

- 5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
- 6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
- 7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
- 8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
- 9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Source Code Availability

Per the GPL and other "open source" license agreements the complete machine readable source code for programs covered by the GPL or other "open source" license agreements is available from Barracuda Networks at no charge. If you would like a copy of the source code or the changes to a particular program we will gladly provide them, on a CD, for a fee of \$100.00. This fee is to pay for the time for a Barracuda Networks engineer to assemble the changes and source code, create the media, package the media, and mail the media. Please send a check payable in USA funds and include the program name. We mail the packaged source code for any program covered under the GPL or other "open source" license.
